

Cost-Benefit Analysis

Phragmites: An Expensive Invasive Species in Ontario

Invasive species can threaten community safety and the natural world.

Phragmites is an invasive perennial grass, commonly found along roadside ditches, that forms dense monocultures and can reach heights of up to 5 metres. Phragmites reduces **biodiversity**, threatens **Critical Habitat & Species at Risk**, and contributes to a variety of **economic impacts**.

In 2019, an estimated expenditure survey completed by Ontario municipalities and Conservation Authorities determined **Phragmites** ranked **fifth most costly** among all invasive species².

It's estimated that in 2019, **6.3%** of funding for **invasive species control and management** in Ontario was directed to **Phragmites**¹.

Phragmites can grow tall, **reducing visibility** for **birdwatchers** and **hikers**.

The most **common pathway** of spread for Phragmites is through **heavy equipment**.

Phragmites forms dense stands, **restricting access** for **swimming, boating, and angling**.

Costs for roadside Phragmites control often **exceeds \$1,100 per kilometer**.

Phragmites **stems** and **seeds** can be flattened, getting **stuck in the tracks**, and **introduced to a new area**.

Invasive
Species
Centre

GREEN SHOVELS is an informal coalition of conservation organizations working collaboratively to address invasive species, delivering co-benefits to support local communities and the environment.

The **INVASIVE SPECIES CENTRE** is a non-profit organization that connects stakeholders, knowledge and technology to prevent and reduce the spread of invasive species that harm Canada's environment, economy, and society.
