1.0 INTRODUCTION

Pinchin Ltd. (Pinchin) was retained by the Corporation of the Municipality of Magnetawan (Municipality) to prepare the 2024 annual groundwater and surface water monitoring report for the Chapman Waste Disposal Site (the Site). The following report provides a detailed evaluation and summary of the 2024 monitoring data and was completed to constitute the 2024 Annual Monitoring Report. This document includes, but is not limited to a summary of historical geochemical data, a review/evaluation of the historical and current geochemical data (as well as groundwater flow) and a summary of geochemical trends.

The purpose of completing the monitoring program was to assess the hydraulic media for contaminants of concern as a compliance requirement under the Site Certificate of Approval (CofA, now referred to as Environmental Compliance Approval (ECA)) Number **A521202** and the applicable regulatory requirements during the spring and fall of 2024. To achieve the reporting objectives of this Site monitoring program, Pinchin carried out groundwater and surface water sampling at the Site in general accordance with the documents referenced within this report.

1.1 Location

The Site property is located on Lot 108, Concession A within the Municipality of Magnetawan, District of Parry Sound, Ontario and is located approximately 5.5 kilometres (km) northeast of the Township of Magnetawan, Ontario. The Site is situated in an undeveloped area, and the visibility of landfilling activities is limited from the adjacent roadway due to mature tree growth. The Site location is indicated on Figure 1 (all Figures are provided in Appendix I). The Site plan is illustrated on Figure 2.

The Site is located at Universal Transverse Mercator (UTM) coordinates Zone 17U, 606,831 metres (m) Easting and 5,063,200 m Northing (North American Datum 1983). Landfill coordinates were obtained using a Global Positioning System and are accurate within 10 m.

1.1.1 Site Survey and Aerial Photography

At the time of preparation of this report, previous survey information of the Site and existing monitoring well elevations were provided to Pinchin for review. During September 2018, Pinchin installed additional monitoring wells at the Site. A survey of the top of casings for these newly installed wells was completed by Pinchin in 2020. The available top of casing monitoring well elevation data obtained from the previous survey and the 2020 survey was used in the following sections of this report to calculate groundwater elevation contours. It is noted that repairs were completed at groundwater monitoring wells BH1 and BH3-II during the fall 2024 monitoring event which required the PVC riser to be cut; the top of casing

© 2025 Pinchin Ltd.

(TOC) surveyed elevations at these monitoring locations will therefore require adjustment for the 2025 groundwater elevation calculations by reducing the survey elevation by the measured length of cut PVC.

A topographic survey of the Site was completed by Pinchin using an Unmanned Aerial Vehicle (UAV) in 2021 and was utilized for the purpose of calculating the remaining waste capacity and remaining lifespan for the Site. The 2021 topographic survey is presented on Figure 3.

The results of the previous topographic survey completed in 2019 indicated that the Site had an approximate remaining capacity of 38, 267.60 cubic meters (m^3) and an approximate remaining Site lifespan of 15 years. Pinchin completed a report for the Municipality of Magnetawan titled "*Waste Capacity Study, Chapman Waste Disposal Site, Magnetawan, Ontario*" dated September 24, 2019, which further discussed the results of the 2019 topographic UAV survey.

In comparing the 2019 and 2021 topographic surveys, it was estimated that approximately 4,750 m^3 of waste was deposited at the Site resulting in a remaining capacity of approximately 33,500 m^3 as of 2021. An additional UAV survey was completed in 2023 in order to provide a current assessment of the existing deposited waste volume and an update of the waste disposal rates. The assessment of the existing waste volume, remaining capacity and waste deposition rate are included under a separate cover.

1.2 Ownership and Key Personnel

The Site is owned and operated by the Corporation of the Municipality of Magnetawan, located in Magnetawan, Ontario. The project was completed for the following representative on behalf of the Municipality:

Kerstin Vroom, Clerk/CAO

Municipality of Magnetawan Government Office

4304 Highway #520

Magnetawan, Ontario P0A 1P0

The Competent Environmental Practitioner (CEP) for the Site groundwater and surface water monitoring program was Tim McBride of Pinchin Ltd.:

Tim McBride, B.Sc., P.Geo., QP_{ESA}

Pinchin Ltd.

662 Falconbridge Road, Unit 3

Sudbury, Ontario P3A 4S4

© 2025 Pinchin Ltd.

1.3 Description and Development of the Site

The Site is operated as a landfill for municipal and non-hazardous solid, domestic and commercial wastes to be utilized by residences of the area. The Site was approved with a total fill area of 1.2 hectares (ha) within a 41-ha property. A copy of the Site's CofA is provided in Appendix II. A road with a locked gate is located northwest of the Site which provides access to the Site from the southeast side of Rocky Road approximately 200 m east of the intersection of Rocky Road and Nipissing Road North. Landfilling began at the Site prior to 1980, and the active landfilling area is currently located within the central portion of the Site.

A map illustrating the site features, landfill boundary and property boundary is provided as Figure 2.

1.3.1 Site Document Review

Pinchin reviewed the following reports for the Site and are referenced within this document:

- Report entitled "*2017 Annual Monitoring Report, Chapman Waste Disposal Site, Magnetawan, Ontario*" completed by D.M. Wills Associates Limited for the Corporation of the Municipality of Magnetawan dated March 2018 (the 2017 D.M. Wills Monitoring Report);
- Report entitled "*2018 Annual Monitoring Report, Chapman Waste Disposal Site, Magnetawan, Ontario*" completed by D.M. Wills Associates Limited for the Corporation of the Municipality of Magnetawan dated March 2019 (the 2018 D.M. Wills Monitoring Report);
- Report entitled "*Landfill Leachate Evaluation, Chapman Waste Disposal Site*" completed by Pinchin for the Corporation of the Municipality of Magnetawan dated July 6, 2018;
- Report entitled "*Leachate Management Plan Study, Chapman Waste Disposal Site, Magnetawan, Ontario"* completed by Pinchin for the Corporation of the Municipality of Magnetawan dated April 30, 2019 (the 2019 Leachate Management Study Report);
- Report entitled *"Waste Capacity Study, Chapman Waste Disposal Site, Magnetawan, Ontario"* completed by Pinchin for the Corporation of the Municipality of Magnetawan dated September 24, 2019 (the 2019 Waste Capacity Study Report);
- Report entitled "*2019 Annual Monitoring Report, Chapman Waste Disposal Site, Magnetawan, Ontario*" completed by Pinchin for the Corporation of the Municipality of Magnetawan dated December 12, 2019 (the 2019 Pinchin Monitoring Report);

© 2025 Pinchin Ltd.

- Report entitled "*2020 Annual Monitoring Report, Chapman Waste Disposal Site, Magnetawan, Ontario*" completed by Pinchin for the Corporation of the Municipality of Magnetawan dated February 5, 2021;
- Report entitled "*2021 Annual Monitoring Report, Chapman Waste Disposal Site, Magnetawan, Ontario*" completed by Pinchin for the Corporation of the Municipality of Magnetawan dated March 31, 2022;
- Report entitled "*Updated Trigger Level Monitoring Plan, Chapman Waste Disposal Site, Magnetawan, Ontario*" prepared by Pinchin dated September 13, 2022 (the Updated Trigger Plan Report);
- Report entitled "*2022 Annual Monitoring Report, Chapman Waste Disposal Site, Magnetawan, Ontario*" completed by Pinchin for the Corporation of the Municipality of Magnetawan dated January 30, 2023; and
- Report entitled *"2023 Annual Monitoring Report, Chapman Waste Disposal Site, Magnetawan, Ontario"* completed by Pinchin for the Corporation of the Municipality of Magnetawan dated February 28, 2024.

A copy of these documents can be obtained from the Client. Pinchin has relied on the information available in the previous environmental reports reviewed for the Site as part of this assessment. Information reviewed within these reports is referenced in pertinent sections throughout this document.

1.4 Monitoring and Reporting Program Objectives and Requirements

The site specific CofA does not detail the monitoring and reporting requirements for the Site. The monitoring and reporting completed by Pinchin has been generally developed based on the Ministry of Environment, Conservation and Parks (MECP) document entitled "*Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water Technical Guidance Document*" dated November 2010, as well as the Client's request for 2024 monitoring and annual reporting. A copy of the CofA for the Site is provided in Appendix II.

1.5 Assumptions and Limitations

Pinchin has assumed that the information generated from historical investigations is accurate and has been completed in accordance with standard engineering practices and regulations. It should be noted that the historical background information made available to Pinchin by the Client was limited; and therefore, previous reports have been relied on for information where required.

The scope of the monitoring activities was limited to the parameters listed in the previous monitoring reports for groundwater and surface water and was limited to the immediate area surrounding the Site.

© 2025 Pinchin Ltd.

The investigations were limited solely to the groundwater within the monitoring well installations on-Site and the surface water surrounding the Site. The investigation does not constitute an exhaustive investigation of the Site property or adjacent properties for potentially unknown contaminants and/or other unknown sources of environmental impact.

Pinchin's limitation of liability and scope of work is as follows:

- The work performed in this report was carried out in accordance with the Terms and Conditions made part of the contract. The conclusions presented herein are based solely upon the scope of services and time and budgetary limitations described in the contract;
- The report has been prepared in accordance with generally accepted environmental study and/or engineering practices. No other warranties, either expressed or implied, are made as to the professional services provided under the terms of the contract and included in this report;
- The services performed and outlined in this report were based in part upon a previously installed monitoring network established by others and approved by the applicable regulatory agencies. Pinchin's opinion cannot be extended to portions of the Site which were unavailable for direct observations reasonably beyond the control of Pinchin;
- The objective of this report was to assess the water quality conditions at the Site, given the context of the contract, with respect to existing environmental regulations within the applicable jurisdiction;
- The Site history interpreted herein relies on information supplied by others such as local, provincial and federal agencies, as well as Site personnel. No attempt has been made to independently verify the accuracy of such information unless specifically noted in this report;
- Pinchin's interpretations relating to the landfill-derived leachate plume at the Site are described in this report. Where testing was performed, it was executed in accordance with the contract for these services. It should be noted that other compounds or materials not tested for may be present in the Site environment;
- The conclusions of this report are based in part on the information provided by others. The possibility remains that unexpected environmental conditions may be encountered at the Site in locations not specifically investigated. Should such an event occur, Pinchin must be notified in order that we may determine if modifications to the conclusions presented herein are necessary;

© 2025 Pinchin Ltd.

- The utilization of Pinchin's services during future monitoring at the Site will allow Pinchin to observe compliance with the conclusions and recommendations contained herein. It will also provide for changes as necessary to suit field conditions as they are encountered; and
- Any use which a third party makes of this report, or any reliance on or decisions to be made based on it is the responsibility of such third parties. Pinchin accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

2.0 PHYSICAL SETTING

2.1 Geology and Hydrogeology

A detailed investigation of the Site geology and hydrogeology was outlined in the 2019 Leachate Management Study Report completed by Pinchin. Based on the report, the regional geology at the Site is dominated by the presence of shallow Precambrian bedrock with a thin veneer of overburden deposits and frequent bedrock outcroppings. Details provided in the 2017 and 2018 D.M. Wills Monitoring Reports indicated that an incised bedrock low was observed trending southwest to northeast and was infilled with glaciolacustrine sand deposits of depths of up to 10 m. Based on these observations, the hydrogeological setting of the Site can best be described as a buried bedrock valley of low permeability, infilled with course granular materials of high permeability. This setting results in a flow system that is contained within the overburden infill materials, but significantly controlled by bedrock topography.

According to the 2019 Leachate Management Study Report, it has been suggested that the landfill development may have been initiated within a historical aggregate extraction pit on the western half of the Site with a bedrock high located in the central portion of the landfill footprint area. This second bedrock high trends easterly and results in bedrock outcrop east to the fill deposits with a significant topographic slope towards the south.

Pinchin installed seven new monitoring wells at the Site between September 26 to 28, 2018, for the Hydrogeology Assessment as part of the 2019 Leachate Management Plan Study. Based on the results of these well installations, the subsurface soil conditions at the Site are observed to consist of coarse sand or sand and silt overburden materials. Bedrock was encountered at the Site at depths of approximately 2 metres below ground surface (mbgs) to 4 mbgs in wells located towards the south and the east of the Site. Borehole logs for the newly installed monitoring wells on-Site are provided in Appendix III. No other borehole logs were provided to Pinchin for review.

© 2025 Pinchin Ltd.

Based on the 2019 Leachate Management Study report, the groundwater flow system most representative of the performance of the Site occurs within the underlying unconfined overburden aquifer. Bedrock drilling in the area suggests very competent rock with limited significant water-bearing fractures. The presence of a pronounced bedrock ridge located near the middle of the Site, which trends west to east, appears to present a buried bedrock valley. This feature confines the horizontal and vertical extent of the landfill leachate impacts, but also results in the discharge of these waters to the surface along a bedrock plane that outcrops in the incised valley associated with adjacent surface water features.

Static water levels were recorded by Pinchin in all of the accessible wells for each of the 2024 groundwater monitoring events. Water levels were measured prior to purging and developing in preparation for sampling to ensure the water levels are representative of static conditions. A summary of the spring and fall 2024 groundwater elevations, as measured by Pinchin personnel, are presented in Table 1 (all tables are provided in Appendix IV).

In general, the static groundwater levels exist within 7.5 m of surface for most wells with the deepest depth to water in 2024 (7.38 mbgs) recorded at BH4-II during the fall monitoring event. In the monitoring wells directly downgradient of the landfill deposits, the static water levels range between 1 to 6 m below grade and become deeper with distance from the landfill footprint with static levels ranging between 4 to 5 m towards the eastern portion of the existing groundwater monitoring network (i.e., BH5-II, BH6-III and BH8-I).

Groundwater movement at the Site has been established (by water level contouring) as being directed towards the northeast and is similar to that of the orientation of the buried bedrock valley confirming the conceptual model of a flow system influenced by the underlying bedrock topography.

2.2 Surface Water Features

According to previous annual water quality monitoring reports, the 2019 Leachate Management Study Report and the findings of a Site visit completed by Pinchin, it is documented that two surface water features are present in the immediate vicinity of the Chapman Waste Disposal site.

The first creek exists along the southern perimeter of the landfill area flowing from west to east. Surface water monitoring location SW1 is situated within this creek in an upstream area. This creek flows year-round with varying flow rates depending on meltwater and precipitation events. The second creek exists along the eastern perimeter of the landfill, flowing from north to southeast. Surface water monitoring location SW3 is situated within this creek. This creek is more ephemeral in nature with very small flows outside of seasonal precipitation-based events. The 2019 Leachate Management Study Report indicates that there is currently a leachate seep located on the banks of the second tributary

© 2025 Pinchin Ltd.

upstream of the confluence with the larger creek. Surface water monitoring location SW2 is situated downstream of the confluence of the two streams at a culvert on Millers Road.

2.3 Historical Data

Pinchin reviewed the 2017 and 2018 D.M. Wills Annual Monitoring Reports, as well as the 2020, 2021, 2022 and 2023 Pinchin Monitoring Reports to evaluate historical data and groundwater and surface water quality conditions. No other water quality data from the existing monitoring well network was available to review as part of this monitoring program.

2.3.1 Historical Groundwater Data

Monitoring well BH3 was determined to be located upgradient of the waste deposits and has historically been used to monitor background water quality at the Site. This monitoring well was observed during the fall 2017 sampling event to have been destroyed as a result of earthmoving/landfilling operations at the Site. Monitoring well BH3-II was installed in 2018 by Pinchin as a replacement and was considered representative of background water quality at the Site. In 2019, an average of the historical results from previous background monitoring well BH3 and the current results from newly installed monitoring well BH3-II was applied as the source of background water quality for the Guideline B-7 calculations. In accordance with comments received from the MECP, the Guideline B-7 calculation was completed in 2020 and 2021 using an average of the results from the new upgradient monitoring wells BH3-II and BH11. However, in accordance with MECP comments received, groundwater quality at monitoring well BH3-II has observed exceedances of the ODWQS for DOC, aluminum and pH which appear to indicate potential leachate influence at this well. It is therefore interpreted that BH3-II is located too close to the landfill boundary to be considered representative of background water quality. Groundwater quality observed at new background monitoring well BH11, located downgradient and further from the landfill boundary, appears to indicate no leachate influence. Therefore, the new background well identified as BH11 has been utilized as the source for background water quality at the Site since 2022.

Based on the results of the previous monitoring reports, significant landfill related impacts at the Site were not identified. The reports indicated that moderate leachate impacts were observed immediately downgradient of the Site which naturally attenuated with further distance from the Site; however, temperate leachate impacts were identified at the furthest downgradient wells. Elevated concentrations of total dissolved solids (TDS), iron, nitrate, dissolved organic carbon (DOC), aluminum and manganese parameters within the groundwater samples analyzed at the furthest downgradient monitoring locations were in exceedance of the Guideline B-7 criteria in 2020, 2021, 2022 and 2023.

© 2025 Pinchin Ltd.

These parameters are all related to operational guidelines and/or aesthetic objectives associated with drinking water systems set by the ODWQS and are not considered to be an immediate significant human health or environmental concern originating from the Site with the exception of nitrate which is a health-related parameter. The elevated concentrations of nitrate were only quantified in some downgradient wells and often fluctuate throughout the historical record. It was noted that these concentrations should be confirmed during future monitoring events. Furthermore, concentrations of nitrate quantified at the downgradient groundwater wells were not interpreted to be impacting the surface water quality at the Site as nitrate concentrations are observed to be at low levels at downstream monitoring location SW2 and SW3.

2.3.2 Historical Surface Water Data

A review of the previous monitoring reports identified leachate effects at the immediately downgradient surface water location SW3 and minor leachate effects at further downstream surface water location SW2. The reports indicated that the leachate effects observed were relatively minor with concentrations below the Provincial Water Quality Objectives (PWQO) except for naturally elevated pH (low), iron, aluminum and cobalt which were also observed at background monitoring location SW1. In addition, concentrations of phosphorus during spring and cadmium in fall were observed to exceed the PWQO at SW2. These concentrations were interpreted to be anomalous and were recommended to be confirmed during future monitoring events. Based on the results of the report, significant concentrations of landfill related contaminants were not observed at downgradient surface water receptors.

2.3.3 Historical Site Performance

The Site currently operates as a typical natural attenuation waste disposal facility. No liner or other leachate collection/management system is in place at the Site. The 2019 Leachate Management Plan Study report indicated that a leachate-impacted groundwater seep/spring had been identified in a downgradient area (east of the Site, upstream from SW3 and in the vicinity of well BH9), resulting in the discharge of said waters to an adjacent surface water feature. This discharge essentially short circuits the natural attenuation process and has the potential to have negative effects on the surface water feature. The Municipality initiated a proactive approach to leachate management and retained Pinchin to complete the Leachate Management Plan Study. The surface water quality data collected for the study indicated that an impact from the leachate seep is being observed in the two adjacent creeks, and it was recommended that steps should be taken to eliminate the seep. These steps include infilling the incised valley and relocating the creek to eliminate the seep, creating an extended CAZ boundary for additional leachate attenuation to occur prior to discharge to surface water bodies. The report also outlined a trigger level program and contingency plan recommended to be implemented at the Site following the elimination

© 2025 Pinchin Ltd.

of the seep to monitor the impacts. The trigger level program is in the process of being developed as a stand-alone document in consultation with the MECP.

3.0 METHODOLOGY

3.1 Scope of Work

The objectives of the monitoring program as requested by the Client included the following scope of work:

- Mobilization to the Site during the spring and fall of 2024 and collection of groundwater and surface water samples from the existing well network and surface water monitoring locations;
- Submission of the groundwater and surface water samples to an accredited analytical laboratory for analysis of the chemical parameters outlined in the previous monitoring reports; and
- Preparation of a report outlining the 2024 field work completed and the analytical results, an evaluation of the results and any subsequent recommendations.

The investigation methodology was also conducted in general accordance with, and reference is made to the following regulatory and guidance documents:

- MECP document entitled "*Guidance on Sampling and Analytical Methods for Use atContaminated Sites in Ontario*" dated December 1996 (MECP Sampling Guideline);
- MECP document entitled "*Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act*" dated March 9, 2004, amended July 1, 2011 (Analytical Methods);
- Ontario Regulation 169/03 "*Ontario Drinking Water Quality Standards*" under the Safe Drinking Water Act (ODWQS) dated 2002;
- MECP document entitled "*Technical Support Document for Ontario Drinking WaterStandards, Objectives and Guidelines*" dated June 2003 (ODWQS Guideline);
- MECP document entitled "*Incorporation of the Reasonable Use Concept into MECPE Groundwater Management Activities, Guideline B-7 (formerly 15-08)*" (Guideline B-7) dated April 1994;
- MECP document entitled "*Determination of Contaminant Limits and Attenuation Zones, Procedure B-7-1*", (formerly referenced by 15-08) dated 2015 and updated in 2022;
- Ontario Regulation 903 R.R.O. 1990 "*Wells*" under the Ontario Water Resources Act (asamended);

© 2025 Pinchin Ltd.

- MECP document entitled "*Water Management Policies Guidelines Provincial Water Quality Objectives*" (PWQO) dated July 1994, revised February 1999;
- MECP document entitled "*Rationale for the Development of Soil and Groundwater Standards for Use at Contaminated Sites in Ontario*" (Table 3.1 - Aquatic Protection Values (APV)) dated April 15, 2011; and
- Canadian Council of Ministers of the Environment (CCME) document entitled "*Canadian Environmental Quality Guidelines*" (Water Quality Guidelines for the Protection of Freshwater Aquatic Life) dated 1999 (CWQG).

3.2 Groundwater Monitoring Well Locations

Seven (7) overburden groundwater monitoring wells have historically been utilized at the Site (BH1, BH2, BH3, BH4, BH5-II, BH6-II and BH7-II). As part of the leachate management plan study completed by Pinchin, several additional monitoring wells were installed at the Site during September 2018 to support the existing monitoring well network. This included the addition of two new background wells (BH11 and BH3-II) to replace the previously destroyed BH3, one cross-gradient well (BH10-I), deeper nested wells at two existing monitoring locations which are consistently dry (BH4-II and BH6-III) and two additional downgradient wells (BH8-I and BH9-I). The locations of all the monitoring wells included in the current monitoring program are illustrated on Figure 4. Detailed locations with coordinates in NAD 83 and the available monitoring well elevations for top of casing are provided in Table 1.

All groundwater monitoring wells were sampled during the spring and fall 2024 sampling events with the exception of BH6-II during the spring and fall due to dry conditions observed at the time of the respective monitoring events, as well as BH-4 during the fall due to insufficient volume at the time of sampling.

All wells were inspected and found to be in good condition, and no wells displayed evidence of a condition non-compliant with Ontario Regulation 903 (O. Reg. 903). During the fall 2024 monitoring event, Pinchin modified monitoring wells BH1 and BH3-II which had PVC riser too tall to close the casing lid. These monitoring wells are now in compliance with O. Reg. 903. A photographic log of all groundwater monitoring wells is provided in Appendix V.

The following table presents a summary of the construction details and respective on-Site positions of the newly installed groundwater monitoring wells based on the borehole logs provided in Appendix III. Construction details for the other existing monitoring wells at the Site (BH1, BH2, BH4, BH5-II, BH6-II and BH7-II) are unknown as the borehole logs for the historic monitoring wells are not currently available.

© 2025 Pinchin Ltd.

Well ID	Total Depth (mbgs)	Screened Interval (mbgs)	Unit Screened
BH3-II	6.10	3.05 – 6.10	Sand and silt
BH4-II	8.44	5.1 – 8.44	Bedrock
BH6-III	6.30	3.05 – 6.05	Bedrock
BH8-I	6.05	3.0 – 6.05	Sand and gravel
BH9-I	7.50	4.4 – 7.5	Sand and Silt
BH10-I	4.88	1.8 – 4.88	Bedrock
BH11	4.88	1.8 – 4.88	Sand and silt

The following table summarizes the location of each of the monitoring wells with respect to its rationale in the annual monitoring program.

Well ID	Condition	Location	Rationale
BH1	Good	East portion of the Site adjacent to the waste deposits	Immediately Downgradient
BH2	Good	East portion of the Site adjacent to the waste deposits	Immediately Downgradient
BH3-II	Good	West of the Site	Upgradient
BH4	Good	East portion of the Site adjacent to the waste deposits	Immediately Downgradient
BH4-II	Good	East portion of the Site adjacent to the waste deposits	Immediately Downgradient
BH5-II	Good	East of the Site	Downgradient
BH6-II	Good	East of the Site	Downgradient
BH6-III	Good	East of the Site	Downgradient
BH7-II	Good	East of the Site	Downgradient
BH8-I	Good	East of the Site	Downgradient
BH9-I	Good	East of the Site	Downgradient

© 2025 Pinchin Ltd.

Well ID	Condition	Location	Rationale
BH10-I	Good	South of the Site	Cross-gradient
BH11	Good	Southwest of the Site	Background

3.3 Surface Water Monitoring Locations

The Site has three (3) historical points for surface water monitoring; SW, SW2 and SW3. An additional surface water monitoring location (SEEP) has been sampled for the Site since 2021 in accordance with comments received from the MECP regarding the existing leachate seep at the Site. All surface water monitoring locations were monitored during the spring and fall 2024 sampling events. The following table illustrates the location of each of the surface water monitoring locations with respect to its rationale in the annual monitoring program.

Monitoring Well ID	Location	Rationale
SW1	Within the creek located south of the Site.	Upstream Monitoring Location
SW2	Downgradient of the intersection of the two intermittent creeks at the Site at the culvert on Millers Road.	Further Downstream Monitoring Location
SW3	Within the creek located east of the Site.	Downstream Monitoring Location
SEEP	Leachate seep located upgradient of SW3.	Leachate Monitoring Location

The locations of the surface water monitoring locations are illustrated on Figure 4. Details regarding the surface water monitoring locations are provided in Table 2. Photos of all surface water monitoring locations are provided in Appendix V.

3.4 Monitoring Frequency

As per previous annual monitoring events, groundwater and surface water was sampled twice annually by Pinchin during 2024 in the spring and fall. The groundwater and surface water sampling events occurred on the following dates:

- Spring – April 23, 2024; and
- Fall – October 2, 2024.

© 2025 Pinchin Ltd.

3.5 Monitoring Parameters

3.5.1 Groundwater Monitoring Parameters

Groundwater samples were submitted for laboratory analysis of the parameters listed in the previous monitoring reports. Monitoring well BH4-II was also sampled for mercury and volatile organic compounds (VOCs). At the time of sample collection, field readings were measured for the following parameters: temperature, pH, conductivity, oxidation reduction potential (ORP) and dissolved oxygen (DO).

3.5.2 Surface Water Monitoring Parameters

Surface water samples were submitted for laboratory analysis of the parameters listed in in the previous monitoring reports. At the time of sample collection, field readings were measured for the following parameters: temperature, pH, conductivity, ORP and DO were measured.

3.6 Monitoring Procedures and Methods

3.6.1 Standard Operating Procedures

The following Pinchin Standard Operating Procedures (SOPs) were followed by Pinchin field personnel for each portion of this project:

- Groundwater Sampling SOP; and
- Surface Water Sampling SOP.

All Pinchin monitoring SOPs have been developed in accordance with the MECP Sampling Document and are consistent with standard engineering practices.

3.6.2 Groundwater Monitoring Activities

To perform the groundwater monitoring activities, the following tasks were conducted:

- Pinchin notified the Client prior to field activities, and subsequently mobilized staff to the Site to complete the sampling program;
- Static groundwater levels were collected using a Solinst™ water level tape. Measurements were collected from the top of riser pipe;
- During the monitoring events, groundwater from each monitoring well was purged prior to the collection of the sample using a moderate-flow sample methodology via high-density polyethylene (HDPE) or low-density polyethylene (LDPE) 3/8” tubing and a Waterra™ inertial foot valve system. The inertial pump system was chosen as an approved method to minimize sediment/particulate within each sample and to minimize sample agitation and well trauma in accordance with the MECP Sampling Document. Pinchin purged a

© 2025 Pinchin Ltd.

minimum of three well volumes to a maximum of six well volumes, or until dry using the inertial pump system until the well volume column was representative of the surrounding formation. During purging activities, additional groundwater monitoring parameters were collected from each monitoring well using a YSI-556 water quality meter for measurement of field parameters. Sample residual was disposed of onto the ground surface, on-Site and upgradient within the landfill confines;

- Groundwater samples were collected using the inertial pump system in accordance with the MECP Sampling Document. Dissolved metals were field-filtered using a dedicated in-line 0.45-micron disposable filter. Upon completion of field sampling and monitoring activities, all samples collected were submitted to the project laboratory SGS Canada Inc. (SGS) in Lakefield, Ontario. All parameters were analyzed by the project laboratory using MECP approved procedures and are consistent with the analytical methods prescribed in the Analytical Methods document; and
- The groundwater samples collected were analyzed at the project laboratory for the parameters listed in the previous monitoring reports. Groundwater sample results were compared to the applicable ODWQS as applied in accordance with the ODWQS Guideline document. Groundwater wells located near surface water features were also compared to the applicable APV standards. Groundwater sample results were also compared to the reasonable usage parameters and were assessed using Guideline B-7 to establish and determine levels of contaminant discharges to the groundwater formation which would be considered acceptable by the MECP from naturally attenuating landfill sites with respect to human consumption and potable considerations.

3.6.3 Surface Water Monitoring Activities

To perform the surface water monitoring activities, the following tasks were conducted:

- Pinchin notified the Client prior to field activities, and subsequently mobilized to the Site;
- All field activities at each monitoring location were initiated at downstream locations working upstream to avoid sediment disturbance and influencing sample integrity;
- Care was taken during collection of surface water samples to ensure that a representative sample was collected, and that underlying sediments were not disturbed. For the surface water samples only, no filtration was done (in accordance with MECP surface water sampling protocols);

© 2025 Pinchin Ltd.

- Surface water samples were collected during each sampling event using a direct grab sampling methodology in accordance with the MECP Sampling Document. Upon completion of field sampling and monitoring activities, all samples collected were submitted to SGS. All parameters were analyzed by the project laboratory using MECP approved procedures and are consistent with the analytical methods prescribed in the Analytical Methods document;
- During sampling activities, surface water monitoring field parameters were collected at each surface water monitoring location using a YSI-556 water quality meter; and
- Surface water samples were analyzed during the monitoring event at the pre-determined monitoring locations for parameters listed in the previous monitoring reports. Sample results were compared to the applicable PWQO and CWQG criteria.

3.6.4 Groundwater and Surface Water Field Measurements

Prior to sampling groundwater in the wells, Pinchin monitored groundwater depth using a Solinst™ electronic water level meter. The water level tape is calibrated in 1.0 mm increments. Reproducibility of the depth measurements is generally within 2.0 mm or less.

Subsequent to groundwater depth measurement and during purging activities, additional groundwater monitoring parameters were collected from each monitoring well using a YSI-556 water quality meter for measurement of field parameters. Field parameters at each surface water monitoring location were also collected using the YSI-556. Additionally, in accordance with MECP comments, flows were measured at the surface water monitoring locations.

The following field parameters were measured during the monitoring program:

- *Dissolved Oxygen* (DO) refers to the relative quantity of oxygen molecules which are dissolved or carried within a quantity of water. Oxygen enters water as rooted aquatic plants and algae undergo photosynthesis and as oxygen is transferred across an air and water interface. Oxygen's solubility in water is indirectly correlated with water's temperature, salinity and pressure. DO concentrations have a significant effect on groundwater quality by regulating the valence state of trace of metals and constraining the bacterial metabolism of dissolved organic species;
- *Conductivity* is the measurement of water's capacity to pass an electrical current. It is considered to be a reasonable indicator of ionic activity and dissolved solids concentration levels. It is affected by the presence of inorganic dissolved solids which carry a negative charge such as chloride, nitrate, sulphate and phosphate anions or a positive charge such as sodium, magnesium, calcium, iron and aluminum cations.

© 2025 Pinchin Ltd.

Organic compounds such as oil and phenol do not conduct an electrical current very well and would therefore have low conductivity in water. Conductivity is also directly correlated to the water temperature. Specific conductivity is a measurement of conductivity values which have been compensated to 25ºC;

- *pH* is a measure of water's acidic/basic properties on a logarithmic scale from 1 (strongly acidic) to 14 (strongly alkaline or basic). It determines the solubility and biological availability of chemical constituents such as nutrients and heavy metals. For example, in addition to affecting how much and what form of phosphorus is most abundant in the water, pH also determines whether aquatic life can use it. The degree to which heavy metals are soluble determines their toxicity. Metals tend to be more toxic at lower pH values because they are more soluble. Excessively high and low pHs can have serious environmental and health effects. A high pH may cause the release of iron, copper or lead into potable water, corrosion on water pipes and water using appliances and reduces the effectiveness of water disinfection with chlorine. Low pH values corrode substances such as metals and plastics. Fluctuations in groundwater pH values may be indicative of groundwater contamination;
- *Temperature* has a dramatic influence on water quality. The rate of chemical reactions is generally correlated to temperature which in turn affects the biological availability of nutrients within the water. As previously mentioned, oxygen's solubility in water is indirectly correlated with its temperature. Declining concentrations of oxygen within warming water is magnified by aquatic plants increasing metabolism as water temperature increases. Low concentrations of DO weaken aquatic plants resistance to disease, parasites and other pollutants; and
- *Oxidation-reduction potential* (ORP) characterizes the oxidation-reduction state of the water on a scale from approximately -300mV (strongly reducing) up to +500mV (strongly oxidizing). The primary application of ORP is recording significant changes in the redox potential which is observed when purging a stagnant water column in piezometer and replacing it with "fresh" groundwater.

3.6.5 Record Keeping and Field Notes

Field notes were collected during the water quality monitoring events and recorded relevant observations, including, but not limited to:

- Dates and time of work being completed;
- Instrumentation and instrument condition;

© 2025 Pinchin Ltd.

- Calibration methods and results;
- Field parameter measurements;
- Field personnel conducting the investigations;
- Field methods used;
- Sampling location identifications;
- Sampling equipment and condition;
- Sample identification (i.e. type, media, number of containers, etc.);
- Sample preparation methods (i.e. preservatives, filtration, etc.);
- Field QA/QC measurements;
- Field and sample identifiers;
- Anomalous conditions (i.e. damage to monitoring wells);
- Photographs of monitoring wells and monitoring stations;
- Weather conditions at the time of the monitoring events; and
- Field conditions.

All raw data and field notes are preserved and retained in Pinchin's custody.

3.7 Quality Assurance for Sampling and Analysis

Pinchin uses recognized industry standards, including the Canadian Council of Ministers of the Environment (CCME) *Subsurface Assessment Handbook for Contaminated Sites* and MECP's manual *Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario* for conducting environmental assessments. For quality assurance, all work is supervised and internally reviewed by senior staff members. Therefore, various QA/QC protocols were followed during the water quality sampling events to ensure that representative samples were obtained, and that representative analytical data were reported by the laboratory.

Field QA/QC protocols that were employed by Pinchin included the following:

- Clean, labelled and pre-preserved (when applicable) sample containers were provided by the laboratory;
- Water quality samples were placed in laboratory-supplied sample jars;

© 2025 Pinchin Ltd.

- The monitoring wells were purged to remove stagnant water prior to sample collection, so that representative groundwater samples could be obtained. Dedicated purging and sampling equipment was used for monitoring well development, purging and sampling to minimize the potential for cross-contamination;
- All water quality samples were placed in coolers on ice immediately upon collection with appropriate sample temperatures maintained prior submission to the laboratory;
- Dedicated and disposable Nitrile™ gloves were used for all sample handling;
- All non-dedicated monitoring and sampling equipment (i.e. water level meter and YSI-556) was cleaned before initial use and between uses to minimize the potential for cross-contamination by washing with an Alconox™ potable water mixture followed by a deionized water rinse;
- Field duplicate groundwater and surface water samples were collected during the spring and fall sampling event (1 in 10); and
- Sample collection and handling procedures were performed in general accordance with the MECP Sampling Guideline.

The SGS laboratory has an established QA/QC program and is a member of the Canadian Association for Laboratory Accreditation (CALA) and is accredited by the Standards Council of Canada (SCC) for specified environmental analyses.

SGS's internal laboratory QA/QC consisted of the analysis of laboratory duplicate, method blank, matrix spike and spiked blank samples, an evaluation of relative percent difference calculations for laboratory duplicate samples, and an evaluation of surrogate recoveries for the method blank, matrix spike and spiked blank samples.

3.8 Data Quality Evaluation

In order to provide confidence in the data obtained, a comprehensive QA/QC component was included in the monitoring program. The QA/QC procedures developed for this monitoring program are prepared in accordance with MECP Sampling Document and in most cases, exceed the minimum requirements.

Relative per cent difference (RPD) values (the absolute difference between two values divided by the average value and expressed as a per cent) were calculated between the parent sample and the field duplicate as part of the QA/QC program. RPD results of sample and duplicate analyses that are less than 50 percent indicate an acceptable level of analytical uncertainty. RPD values calculated for measured analyte concentrations for sample and duplicate pairs that exceed 50 per cent generally warrant discussion because they may indicate the presence of elevated analytical uncertainty and a potential for

© 2025 Pinchin Ltd.

making interpretive errors based on the analysis results. Use of calculated RPD values to assess analytical uncertainty when using measured analyte concentrations for sample and sample duplicate pairs is not appropriate when either measured analyte concentration is within a multiple of 5 of the method detection limit (a value designated as the practical quantification limit (PQL)) where analytical uncertainty is typically elevated.

All field instrumentation calibration checks were completed by Pinchin field staff members prior to use on-Site. All field operations conducted by Pinchin field staff members were completed using standard equipment decontamination and sampling procedures, and no deviations from the sampling plan were noted.

4.0 ASSESSMENT, INTERPRETATION AND DISCUSSION

4.1 Groundwater Flow Interpretation

The hydraulic flow vector was historically estimated to range to the east. The groundwater flow direction may be influenced by seasonal variations in the amount of precipitation, by aquifer heterogeneity and the buried fill material at the Site. Groundwater level trends indicate seasonal fluctuations in the depth to groundwater which is consistent with seasonal fluctuations in precipitation events. The depth to groundwater measurement results are presented in Table 1.

During the spring monitoring event on April 23, 2024, the depth to groundwater was observed to range from 319.20 meters above sea level (masl) at BH3-II to 287.54 masl at BH5-II. During the fall monitoring event on October 2, 2024, the depth to groundwater was observed to range from 318.80 masl at BH3-II to 287.15 masl at BH5-II.

Accurate triangulation of the water table elevations was undertaken for the 2024 sampling events using the available monitoring well system and the survey elevation data. Pinchin completed a survey in 2020 to obtain elevation data for the newly installed wells at the Site and more accurate elevation data for the historical wells. The inferred groundwater contours for both the 2024 spring and fall events are presented on Figures 5 and 6, respectively. The presentation of the groundwater contours and the associated inferred groundwater flow direction for the 2024 sampling events, as illustrated on Figures 5 and 6, confirms the previous findings of earlier Annual Monitoring Reports which indicate groundwater flow is directed towards the east.

4.2 Groundwater Quality Monitoring

4.2.1 The Reasonable Use Criteria Assessment (RUC)

Guideline B-7, the “reasonable use concept” (RUC) approach, is the MECP’s groundwater management strategy for mitigating the effect of contamination on properties adjacent to its source. It establishes

© 2025 Pinchin Ltd.

procedures for determining what constitutes the reasonable use of groundwater on a property adjacent to sources of contaminants and establishes limits on the discharge of contaminants from landfills which have a potential to migrate hydraulically downgradient and off-site and impair the current and future groundwater use at downgradient properties.

The application of "reasonable use" is outlined in Procedure B-7-1 "*Determination of Contaminant Limits and Attenuation Zones*". The procedure determines the maximum concentration (C_m) of a particular contaminant that would be acceptable in the groundwater beneath an adjacent property and is calculated in accordance with the relationship:

$$C_m = C_b + x\ (C_r - C_b)$$

C_b – This is the background concentration of the particular groundwater contaminant in consideration before it has been affected by human activities. From this, it is possible to calculate the extent of human activities impact on contaminant levels.

C_r – In accordance with the Ontario Water Management Guideline, this is the maximum concentration of a particular contaminant that should be present in the groundwater. This value is dependent on property's use of the groundwater as outlined in B-7. It also allows for the total amount of contamination. Pinchin conservatively assumes that the reasonable use of the groundwater on-site is potentially for potable drinking purposes for which the ODWQS have been established.

X – As determined by the MECP, this constant determines the extent which the contamination has on the groundwater's use. For drinking water, x is 0.5 for non-health related parameters or 0.25 for health-related parameters. For other reasonable uses, it is 0.5.

Contamination concentrations which exceed C_m may have an appreciable effect on the use of an adjacent property, and as such the Site should be managed in a manner to minimize environmental damage, or the operation should be modified. It is acceptable to modify the operation of the disposal site to meet the specified limits. However, if these limits are exceeded, all waste disposals, except for that done in conjunction with a reasonable plan for closure or with remedial activities, should be terminated until the specified limits have been met, or until monitoring data indicate that these limits will be met. Determination of the replacement of contaminated water supplies and the abatement of the contaminant plume must be made on a case-by-case basis in accordance with "*Resolution of Groundwater Quality Interference Problems*", Guideline B-9. For the purpose of evaluating compliance with respect to the RUC, Pinchin has compared the calculated C_m values versus the applicable downgradient compliance monitoring wells (BH5-II, BH6-III, BH7-II, BH8-I and BH9-I).

© 2025 Pinchin Ltd.

Historically, monitoring well BH3 was considered representative of background water quality and was used in the Guideline B-7 calculations (C_b); however, this well was observed to have been destroyed during previous monitoring events. Newly installed monitoring wells BH3-II and BH11 are located furthest potentially hydraulically upgradient of the Site and have been used to estimate the background water quality coming onto the Site from 2019-2021. However, in accordance with MECP comments received, groundwater quality at monitoring well BH3-II has observed exceedances of the ODWQS for DOC, aluminum and pH which appear to indicate potential leachate influence at this well. It is therefore interpreted that BH3-II is located too close to the landfill boundary to be considered representative of background water quality. Groundwater quality observed at new background monitoring well BH11, located downgradient and further from the landfill boundary, appears to indicate no leachate influence. Therefore, the new background well identified as BH11 has been utilized as the source for background water quality at the Site since 2022. The average concentrations of all available sampling events at monitoring well BH11 have been applied as the source of background water quality (C_b) used to calculate the Guideline B-7 RUC values (C_m).

4.2.2 The Ontario Drinking Water Quality Standards (ODWQS)

Through the establishment of the ODWQS, the province of Ontario has determined legally enforceable standards on contaminants in drinking water. The standards are designed to protect public health by restricting the quality of specific contaminants in drinking water. Three categories of contaminates are regulated under the Ontario Regulation 169/03 Drinking Water Standards:

- Microbiological – Originating from human and animals waste, coliforms and bacteria are common in the environment. Most are harmless; however, their presence may be indicative of other harmful bacteria in the water. Under the ODWQS, Escherichia coli (“E. Coli”), fecal coliforms and total coliforms must be non-detectable in drinking water;
- Chemical – ODWQS regulates maximum quantities of organic and inorganic chemicals allowed in drinking water. Industrial discharges or agricultural runoff are not necessarily removed by drinking water treatment. Consuming water exhibiting a greater concentration of these chemicals than the ODWQS may cause serious health problems; and
- Radiation – Natural and artificial radio nuclides are also regulated in the ODWQS. Standards are expressed as maximum allowable concentrations in becquerels per litre (“L”). Radiological contaminants include radio nuclides, such as radium 228, which are caused from the erosion of naturally occurring deposits, or artificial radio nuclides, such as tritium, released into the water by nuclear power plants. Radiological contaminants do

© 2025 Pinchin Ltd.

not naturally occur within the study area and the disposal of radiological waste was not suspected in the Site, and as a result, radiation was not monitored for this study.

The ODWQS Guideline Document is the MECP technical guidance document which provides guidance on applicability of the ODWQS and also provides applicable interim guidelines where legal standards are absent. Both the ODWQS and Guideline B-7 were used in assessing the groundwater results obtained during the 2024 monitoring program.

4.2.3 Aquatic Protection Values (APV)

Under Ontario Regulation 153/04, the MECP have developed APVs to protect aquatic organisms exposed to contaminants from migration of contaminated groundwater to surface water. Protection of aquatic biota from migration of contaminants by overland flow is provided by a Site being designated an environmentally sensitive area if the property includes or is adjacent to a water body or includes land that is within 30 m of a water body.

APVs are designed to provide a scientifically defensible and reasonably conservative level of protection for most aquatic organisms from the migration of contaminated groundwater to surface water resources. Groundwater monitoring wells nearest to the surface water features (BH6-III, BH7-II, BH8-I, BH9-I and BH10-I) are compared to the applicable APV standards to assess the potential impact of groundwater discharge to the surface water bodies.

4.3 Groundwater Results

The following discussion of parameters documents the groundwater quality in comparison to the ODWQS standards and the calculated reasonable use criteria as per Guideline B-7. To implement Guideline B-7, groundwater samples collected from the applicable downgradient monitoring wells (i.e., BH5-II, BH6-III, BH7-II, BH8-I and BH9-I) have been compared to the calculated RUC values (C_m). An average of all valid sampling rounds at monitoring well BH11 has been applied as the source of background water quality for the Guideline B-7 calculations (C_b).

The analytical data for each well in comparison to the applicable regulatory criteria is provided in Tables 3 through 16. An evaluation of the RUC criteria in comparison to the downgradient compliance wells is provided in Tables 17 and 18 for the spring and fall events, respectively. Copies of the laboratory analytical reports are presented in Appendix VI. The following is a breakdown of the water quality observed the monitoring well locations with comparison to the background quality and leachate being produced on-Site.

© 2025 Pinchin Ltd.

4.3.1 Background Water Quality Evaluation

Monitoring Well BH3-II

Background water quality observed west of the waste fill area at BH3-II did not identify elevated levels of common landfill-related contaminant parameters such as conductivity, TDS, chloride, sulphate, calcium, sodium, potassium or nitrate. During the 2024 monitoring period, concentrations of pH (low), hardness (low), alkalinity (low), aluminum and turbidity were quantified outside of the recommended levels specified in the ODWQS. pH, hardness, alkalinity, aluminum and turbidity are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site.

Monitoring Well BH11

Background water quality observed southwest of the waste fill area at BH11 did not identify elevated levels of common landfill-related contaminant parameters such as conductivity, TDS, chloride, sulphate, calcium, sodium, potassium or nitrate; although these concentrations are generally slightly higher compared to those quantified at BH3-II. During the 2024 monitoring period, concentrations of pH (low), hardness (low), alkalinity (low), iron, aluminum and turbidity were quantified outside of the recommended levels specified in the ODWQS. pH, hardness, alkalinity, iron, aluminum and turbidity are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site. These concentrations are considered to be representative of local background groundwater quality.

4.3.2 Leachate Source Quality Evaluation

No groundwater monitoring wells in the existing monitoring well network are situated within the active landfill area to evaluate the source leachate quality. Monitoring wells BH4 and BH4-II are situated in closest proximity to the waste deposits and can be used to estimate the source strength prior to the further downgradient monitoring locations.

Monitoring Well BH4

In comparison to background water quality, groundwater observed immediately east of the waste fill area at BH4 is generally observed to have higher concentrations of conductivity, alkalinity, TDS, nitrate, chloride, sulphate, sodium and calcium indicating temperate impacts from the landfill which is consistent with historical observations at this location. It is expected that the groundwater at this location is impacted with minor amounts of landfill leachate considering its close proximity to the active fill zone. It is noted that an insufficient volume was observed at BH4 during the fall 2024 event. During the spring 2024 monitoring event, elevated hardness (high), DOC and turbidity concentrations were identified at BH4 that exceeded

© 2025 Pinchin Ltd.

the ODWQS. Hardness, DOC and turbidity are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site.

Concentrations of nitrate observed at this location are consistent with the considerable range of fluctuation throughout the historical monitoring record and have returned to concentrations within the ODWQS since the exceedance quantified in spring 2023; however, additional analytical data is required to confirm these decreasing concentrations.

Monitoring Well BH4-II

In comparison to background water quality, groundwater observed immediately east of the waste fill area (nested with well BH4) at BH4-II is generally observed to have higher concentrations of conductivity, alkalinity, TDS, nitrate, chloride, sulphate, calcium, sodium and potassium indicating temperate impacts from the landfill which are similar to those concentrations quantified at BH4. It is expected that the groundwater at this location is impacted with minor amounts of landfill leachate considering its close proximity to the active fill zone. During the 2024 monitoring period, elevated hardness (high), DOC and manganese concentrations were identified at BH4-II that exceeded the ODWQS. Hardness, DOC and manganese are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site.

Concentrations of nitrate observed at this location are consistent with the considerable range of fluctuation throughout the historical monitoring record and have returned to concentrations within the ODWQS since the exceedance quantified in spring 2023; however, additional analytical data is required to confirm these decreasing concentrations.

During the 2024 monitoring events, parameters of mercury and VOCs were not detected in the samples collected in both the spring and fall. This is consistent with the results obtained since the 2021 monitoring period.

4.3.3 Cross-gradient Water Quality Evaluation

Monitoring Well BH10-I

In comparison to background water quality, groundwater observed immediately south of the waste fill area at BH10-I is generally observed to have marginally elevated concentrations of conductivity, TDS, chloride, sodium, calcium and sulphate indicating temperate impacts from the landfill. It is expected that the groundwater at this location is impacted with minor amounts of landfill leachate considering its proximity to the Site. During the 2024 monitoring period, concentrations of hardness (low in spring and high in fall), DOC and turbidity were observed to be outside of the values stated by the ODWQS.

© 2025 Pinchin Ltd.

Hardness, DOC and turbidity are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site. Furthermore, elevated concentrations of turbidity are also quantified at the background monitoring location and therefore are not considered to be landfill derived.

Monitoring well BH10-I is located near the creek located south of the Site and was therefore also compared to the applicable APV standards. All parameter concentrations at BH10-I satisfied the APV during the 2024 monitoring period.

4.3.4 Immediately Downgradient Water Quality Evaluation

Monitoring Well BH1

In comparison to background water quality, groundwater observed immediately east and downgradient of the waste fill area at BH1 is generally observed to have slightly higher concentrations of conductivity, TDS, chloride, sulphate, sodium, potassium and nitrate indicating temperate impacts from the landfill which is consistent with historical observations at this location. It is expected that the groundwater at this location is impacted with minor amounts of landfill leachate considering its proximity to the active fill zone. During the 2024 monitoring period, elevated hardness (high in spring and low in fall), DOC and manganese concentrations were identified at BH1 that exceeded the ODWQS. Hardness, DOC and manganese are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site.

Concentrations of nitrate observed at this location are consistent with the considerable range of fluctuation throughout the historical monitoring record and have returned to concentrations within the ODWQS since the exceedance quantified in 2019. It is noted that an elevated concentration in comparison to those quantified in recent years was observed at BH1 in the fall 2024 monitoring event. Nitrate concentrations should continue to be closely monitored during future events.

Monitoring Well BH2

In comparison to background water quality, groundwater observed immediately east of the waste fill area at BH2 is generally observed to have higher concentrations of conductivity, alkalinity, TDS, chloride, sulphate, sodium and potassium indicating temperate impacts from the landfill which is consistent with historical observations at this location. It is expected that the groundwater at this location is impacted with minor amounts of landfill leachate considering its proximity to the active fill zone. During the 2024 monitoring period, elevated hardness (high), DOC, iron, manganese and turbidity concentrations were identified at BH2 that exceeded the ODWQS. Hardness, DOC, iron, manganese and turbidity are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site.

© 2025 Pinchin Ltd.

4.3.5 Downgradient Water Quality Evaluation

Monitoring Well BH5-II

In comparison to background water quality, groundwater observed east of the Site at BH5-II is generally observed to have higher concentrations of conductivity, alkalinity, TDS, nitrate, chloride, sulphate, calcium, sodium and potassium indicating temperate impacts from the landfill which is consistent with historical observations at this location. It is expected that the groundwater at this location is impacted with minor amounts of landfill leachate. During the 2024 monitoring period, hardness (high), DOC, manganese and turbidity concentrations were identified at BH5-II that exceeded the ODWQS. Guideline B-7 exceedances were quantified at BH5-II during 2024 for DOC, manganese (spring only), TDS (fall only) and nitrate (fall only). Hardness, DOC, TDS, manganese and turbidity are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site. Furthermore, elevated concentrations of DOC and turbidity are also quantified at the background monitoring location and therefore are not considered to be landfill derived.

Nitrate (a health-related parameter) was quantified in the fall at BH5-II to be in exceedance of the Guideline B-7. Concentrations of nitrate observed at this location are consistent with the historical monitoring record and appear to have decreased over time since 2011 and stabilized with a spike in 2015.

Monitoring Well BH6-II

Downgradient monitoring well BH6-II was observed to be dry at the time of sampling during the spring and fall 2024 monitoring events as is consistent with historical observations.

Monitoring Well BH6-III

In comparison to background water quality, groundwater observed east of the Site at BH6-III is generally observed to have slightly higher concentrations of conductivity, alkalinity, TDS, chloride, sulphate, calcium and potassium indicating minor impacts from the landfill. It is expected that the groundwater at this location is impacted with minor amounts of landfill leachate. During the 2024 monitoring period, elevated hardness (high) and manganese concentrations were identified at BH6-III that exceeded the ODWQS and the Guideline B-7 Criteria. Additionally, an exceedance of the Guideline B-7 was also observed for nitrate during the fall 2024 event only. Hardness, DOC and manganese are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site. Furthermore, elevated concentrations of DOC and turbidity are also quantified at the background monitoring location and therefore are not considered to be landfill derived.

© 2025 Pinchin Ltd.

Nitrate (a health-related parameter) was quantified in the fall at BH6-III to be in exceedance of the Guideline B-7. Concentrations of nitrate observed at this location appear to be slightly decreasing over time since installation of this well in 2019 with a spike in fall 2022.

Monitoring well BH6-III is located near the creek flowing from the south of the Site and was therefore also compared to the applicable APV standards. All parameter concentrations at BH6-III satisfied the APV during 2024.

Monitoring Well BH7-II

In comparison to background water quality, groundwater observed east of the Site at BH7-II is generally observed to have generally similar concentrations of conductivity, alkalinity, TDS, chloride, sulphate, calcium, sodium and potassium indicating very minor impacts from the landfill which is consistent with historical observations at this location. During the 2024 monitoring period, pH (low), hardness (low), alkalinity (low), DOC, aluminum and turbidity concentrations were identified at BH7-II that exceeded the ODWQS. Guideline B-7 Criteria exceedances were quantified during 2204 for pH (low, fall only), DOC and aluminum (fall only). These parameters are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site. Furthermore, elevated concentrations of pH (low), hardness (low), alkalinity (low) and turbidity are also quantified at the background monitoring location and therefore are not considered to be landfill derived.

Monitoring well BH7-II is located near the creek flowing from the south of the Site and was therefore also compared to the applicable APV standards. All parameter concentrations at BH7-II satisfied the APV during the 2024 sampling events.

Monitoring Well BH8-I

In comparison to background water quality, groundwater observed east of the Site at BH8-I is generally observed to have higher concentrations of conductivity, alkalinity, TDS, nitrate, chloride, sulphate, calcium, sodium and potassium indicating temperate impacts from the landfill. During the 2024 monitoring period, hardness (high), manganese and turbidity concentrations were identified at BH8-I that exceeded the ODWQS Guideline B-7 criteria exceedances were quantified during 2024 for DOC, manganese and nitrate (fall only). Hardness, DOC, manganese and turbidity parameters are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site. Furthermore, elevated concentrations of DOC and turbidity are also quantified at the background monitoring location and therefore are not considered to be landfill derived.

© 2025 Pinchin Ltd.

Nitrate (health-related parameter) was quantified at BH8-I to be in exceedance of the Guideline B-7 during the fall of 2024. Concentrations of nitrate observed at this location appear to be slightly decreasing over time since installation of this well in 2019 and stabilized in recent years.

Monitoring well BH8-I is located near the creek east of the Site and was therefore also compared to the applicable APV standards. All parameter concentrations at BH8-I satisfied the APV during the 2024 monitoring period.

Monitoring Well BH9-I

In comparison to background water quality, groundwater observed east of the Site at BH9-I is generally observed to have higher concentrations of conductivity, alkalinity, TDS, chloride, sulphate, calcium, sodium and potassium indicating temperate impacts from the landfill. It is interpreted that the groundwater at this location is impacted with minor amounts of landfill leachate. During the 2024 monitoring period, hardness (high), DOC, iron, manganese and turbidity concentrations were identified at BH9-I that exceeded the ODWQS. Guideline B-7 criteria exceedances were quantified during 2024 for DOC, iron, manganese and TDS (spring only). Hardness, TDS, DOC, iron, manganese and turbidity parameters are either operational guidelines or aesthetic objectives for drinking water systems set by the ODWQS and are not considered to be a significant environmental concern originating from the Site. Furthermore, elevated concentrations of DOC and turbidity are also quantified at the background monitoring location and therefore are not considered to be landfill derived.

Monitoring well BH9-I is located near the creek east of the Site and was therefore also compared to the applicable APV standards. All parameter concentrations at BH9-I satisfied the APV during the 2024 sampling events with the exception of marginal cobalt exceedances quantified during the spring and fall, consistent with previous events.

4.4 Groundwater Trend Analysis

A series of time versus concentration graphs were developed to evaluate the concentrations of several select landfill indicator parameters (including alkalinity, chloride, nitrate, pH, and DOC) at each monitoring well for the Site. Current and historical groundwater quality data was utilized to identify any apparent trends or inconsistencies in the water quality within the monitoring well network. The time versus concentration graphs are provided in Appendix VII. It should be noted that the newly installed monitoring wells (BH3-II, BH4-II, BH6-III, BH8-I, BH9-I, BH10-I and BH11) currently only have data available for 2019-2024; therefore, further monitoring is required in order to interpret accurate trends at these locations.

In general, the landfill indicator parameters are demonstrating fairly stable trends with respect to time at all monitoring well locations with some exceptions. Concentrations of alkalinity are generally stable with

© 2025 Pinchin Ltd.

the exception of wells BH1, BH2, BH4, BH5-II and BH10-I which are demonstrating increasing trends, although BH1 appears to be decreasing since 2019 and BH2 and BH4 appear to have stabilized. Chloride, nitrate and DOC concentrations at BH4 have generally been elevated, but have been demonstrating a decreasing trend since 2013. At newly installed BH4-II, DOC and chloride concentrations appear stable while nitrate concentrations also follow a decreasing trend.

Further monitoring investigations are required in order to confirm the interpreted trends observed during this monitoring period.

4.5 Groundwater Field Measurement Results

During the spring and fall of 2024, Pinchin collected groundwater monitoring parameters from each of the well locations using a YSI-556 water quality meter for measurement of field parameters. The field parameter measurements are provided in Tables 3 through 16.

A review of the field parameters for the project identified no significant concerns in the water quality during the monitoring events. The water quality at the Site monitoring locations did not change significantly between each of the monitoring locations and the measured field parameters were within the normal variability associated with shallow groundwater monitoring systems.

4.6 Surface Water Quality Monitoring

4.6.1 The Provincial Water Quality Objectives (PWQO)

The PWQO are numerical and narrative criteria which serve as chemical and physical indicators representing satisfactory levels for surface water and groundwater where it discharges to the surface. The PWQO are levels which are protective of the water quality for all forms of aquatic life during their indefinite exposures to the water. The PWQO levels include protection for anthropogenic recreational water uses where there is a high potential of exposure and are based on public health and aesthetic considerations.

In general, the PWQO stated that the surface water quality of a water body shall be “free from contaminating levels of substances and materials attributable to human activities which in themselves, or in combination with other factors can: settle to form objectionable deposits; float as debris or scum or oil or other matter to form nuisances; product objectionable colour, odour, taste, or turbidity; injure, are toxic to, or produce adverse physiological or behavioural responses in humans, animals, or plants; or enhance the production of undesirable aquatic life or result in the dominance of nuisance species”.

4.6.2 Canadian Water Quality Guidelines (CWQG)

The CWQG were developed by the Canadian Council of Resources and Environment to provide basic scientific information about the effects of water quality parameters on uses in order to assess water

© 2025 Pinchin Ltd.

quality issues and concerns and to establish water quality objectives for specific sites. The guidelines contain recommendations for chemical, physical, radiological and biological parameters necessary to protect and enhance designated uses of water. They apply only to inland surface waters and groundwater and not to estuarine and marine waterbodies. The rationale for each parameter is included to assist in the development of water quality objectives to suit local water conditions.

4.7 Surface Water Results

Pinchin collected surface water samples from all surface water monitoring locations during the spring and fall monitoring events in 2024. A summary of water quality monitoring data relative to the regulatory standards is presented in the attached Tables 19 through 22. Copies of the laboratory analytical reports are presented in Appendix VI.

Surface water monitoring location SW1 located within the creek along the south side of the Site is considered representative of background water quality conditions and is characterized by naturally elevated concentrations of pH (low), phenols, iron, aluminum. Concentrations of pH (low), phenols, iron and aluminum exceeded the PWQO and/or CWQG during the 2024 sampling events which is consistent with the observations at this location throughout the historical monitoring record.

Samples collected at the observed leachate seep location (SEEP) during 2024 indicated elevated levels of most parameters when compared to the background surface water conditions at SW1. Concentrations of phenols, phosphorus, iron, boron, chromium and cobalt were identified to be in exceedance of the PWQO and/or CWQG during 2024.

Minor leachate impacts are observed at the downstream surface water monitoring location SW3 with exceedances quantified for phenols, iron and cobalt during 2024. These impacts are interpreted to improve with distance from the Site as lower concentrations are quantified at further downstream monitoring location SW2. Surface water samples collected further downstream at SW2 had exceedances quantified for phenols and aluminum during 2024. The concentrations observed at this location are consistent with the observations at this location throughout the historical monitoring record.

Additionally, concentrations of nitrate (health-related parameter) quantified at several of the downgradient groundwater monitoring wells are not interpreted to be impacting the surface water quality at the Site as nitrate concentrations are observed to be at low levels at the seepage source area at SW3 and lower still at downstream monitoring location SW2. This interpretation should be confirmed during future monitoring.

4.8 Surface Water Trend Analysis

A series of time versus concentration graphs were developed to evaluate the concentrations of several select landfill indicator parameters (including alkalinity, chloride, nitrate, pH, and DOC) at each surface

© 2025 Pinchin Ltd.

water monitoring location for the Site. Current and historical surface water quality data was utilized to identify any apparent trends or inconsistencies in the water quality at the Site. The time versus concentration graphs are provided in Appendix VIII. It should be noted that the SEEP location currently only has data available for 2021-2024; therefore, further monitoring is required in order to interpret accurate trends at this location.

In general, the landfill indicator parameters are demonstrating stable trends with respect to time at all surface water monitoring locations within a large range of fluctuation with the exception of SW3 which does not demonstrate an identifiable trend for alkalinity or nitrate. Chloride concentrations are noted to be higher at the SEEP location in comparison to the remainder of the surface water monitoring locations, but appear to indicate a decreasing trend. Conversely, chloride concentrations appear to be increasing at the remainder of the monitoring locations, including at background location SW1. Nitrate concentrations are low at all locations and also indicate a decreasing trend at the SEEP location.

Further monitoring investigations are required to confirm the trends observed during this monitoring period.

4.9 Surface Water Field Measurement Results

During the spring and fall of 2024, Pinchin collected surface water monitoring parameters from each surface water monitoring location using a YSI-556 water quality meter for real-time in-situ measurement of field parameters. The field parameter measurements are provided in Tables 19 through 22.

A review of the field parameters for the project identified no significant concerns in the water quality during the monitoring event. The quality at the surface water monitoring locations did not change significantly between each of the monitoring locations.

4.10 Surface Water Flow Measurement Results

Stream flow measurements were conducted on each of the surface water monitoring stations during the spring and fall 2024 monitoring events. Flow measurements are summarized below in the following table.

Sample Station	Flow (m^3/s)	
	Spring 2024	Fall 2024
SW1	0.00	0.007
SW2	0.012	0.003
SW3	0.00	0.002

© 2025 Pinchin Ltd.

4.11 Leachate Characterization

The Site is an operating landfill with minor operational or maintenance being overseen by the Municipality. The Site currently does not have a leachate collection system whereby leachate quality monitoring and characterization is being completed. Currently, there is no groundwater monitoring well included in the existing monitoring well network at the Site that is situated within the active landfill area, or which is considered representative of source leachate water quality. Therefore, leachate at the Site cannot be characterized at the time of preparation of this report. Monitoring wells BH4 and BH4-II are considered near source monitors.

4.12 Contaminant Attenuation Zone

A Contaminant Attenuation Zone (CAZ) has not been established for the Site. However, it should be noted that based on the current observed water quality data, landfill derived leachate impacts appear to attenuate prior to the property boundary (although the current groundwater seep needs to be addressed). Future investigations should involve the development/formal approval of a CAZ for this Site.

4.13 Adequacy of the Monitoring Program

At this time, there is currently no formal monitoring program for the Site. Pinchin recommends continuation of sampling the groundwater and surface water two times per year (spring and fall) to establish any notable trends or impacts emanating from the landfill. The results of inspection and monitoring will continue to be reported annually to the MECP.

During these sampling and reporting events, it is recommended that the monitoring well network be evaluated for adequacy and determine if there is a need for additional monitoring locations.

4.13.1 Monitoring Well Network Efficiency

Pinchin concludes that the current groundwater monitoring well network is considered adequate for evaluating the Chapman Waste Disposal Site geological and hydrogeological characteristics immediately to the east of the landfill (for evaluating downgradient groundwater quality migrating from the Site).

Based on a review of the groundwater contaminant data from BH3 (Destroyed), BH3-II and BH11, the assumed groundwater flow direction and comments received by the MECP, monitoring well BH11 has been identified as a best-case background location. A review of the dataset (as provided on Table 16) from BH11 did not identify elevated levels of common landfill-related contaminant parameters with the exception of hardness and alkalinity which are naturally lower than the ODWQS range and turbidity which is naturally elevated. At this time, monitoring well BH11 is considered adequate for monitoring background groundwater quality. The groundwater quality observed in monitoring well BH11 have been

© 2025 Pinchin Ltd.

used within this report for assessing the Site's water quality data to Guideline B-7 RUC (i.e., background well).

Based on a visual inspection of the monitoring well installations, Pinchin concludes that the monitoring wells are in satisfactory condition.

Borehole logs for several of the wells on-Site are currently not available. The borehole logs for the new monitoring wells installed in September 2018 are provided in Appendix III.

4.14 Supplemental Monitoring: Sediment, Benthic and/or Toxicity Monitoring

No supplemental monitoring was completed as part of the 2024 monitoring program completed by Pinchin.

4.15 Assessment of the Need for Implementation of Contingency Measures

As part of the 2019 Leachate Management Study Report completed by Pinchin in April 2019 and the Updated Trigger Plan report completed by Pinchin in September 2022 in accordance with MECP review comments, a trigger level monitoring program and contingency plan has been proposed for the Chapman Waste Disposal Site. The proposed Trigger Level Monitoring Program for groundwater and surface water is a three-tiered program that includes routine monitoring (i.e. the semi-annual monitoring program), compliance monitoring and confirmation monitoring. It should be noted that the implementation of the trigger level monitoring program is only recommended once the proposed mitigation measures associated with the leachate seep are completed. Additionally, the updated trigger level program is currently being submitted to the MECP for approval under separate cover as a stand alone document.

It is Pinchin's opinion that contingency measures are not required for the Site at the time of preparation of this report.

4.16 Waste Disposal Site Gas Impacts

At this time, no evidence has been documented to suggest that methane gas generation from the Site is a significant concern.

4.17 Effectiveness of Engineered Controls

With the exception of the intermittent landfill cover, there are no operational engineered controls in effect at the Site. The Client should continue to maintain the integrity of the landfill cover as per the CofA. Annual monitoring and inspections should continue to ensure regular maintenance is occurring as needed. At the time of the 2024 monitoring event, no significant damage or concerns were noted.

© 2025 Pinchin Ltd.

4.18 Control Systems Monitoring

Environmental control systems are designed, constructed and utilized at some waste disposal sites to reduce or increase an environmental variable to an acceptable level, or to maintain an environmental variable within an acceptable range in order to prevent a negative environmental outcome.

Certain environmental control systems such as a leachate collection system or a methane gas collection system can provide the basis for operator intervention to bring about or maintain a desired condition to operate the landfill. The Site does not currently operate any control systems; therefore, no control system monitoring was completed as part of the 2024 monitoring program.

4.19 QA/QC Results

In order to provide confidence in the data obtained, a comprehensive QA/QC component was included in the monitoring program. The QA/QC procedures developed for this monitoring program are prepared in accordance with MECP Sampling Document and in most cases, exceed the minimum requirements.

Water quality samples collected by Pinchin were generated in accordance with acceptable procedures. No analytical hold times were exceeded for samples submitted for analyses, and sample temperatures upon receipt at the project laboratory were below 10˚ Celsius.

Two groundwater duplicate sample pairs and one surface water duplicate sample pair were collected from the Site during the spring and fall sampling events and submitted for laboratory analysis of the full suite of analytical parameters. All duplicate data for 2024 are provided in Tables 23 and 24 for groundwater and surface water, respectively.

The following table summarizes the duplicate pairs for 2024:

Sampling Event	Duplicate Sample ID	Original Sample ID
Spring	GW DUP1	BH3-II
	GW DUP2	BH8-I
	SW DUP	SW2
Fall	GW DUP1	BH11
	GW DUP2	BH4-II
	SW DUP	SW1

© 2025 Pinchin Ltd.

The calculated RPDs for the original and field duplicate groundwater sample has been compared to the performance standards considered acceptable by Pinchin (i.e. 50%). Each of the calculated RPDs met the corresponding performance standard with the exception of the following:

- Iron, turbidity, total suspended solids (TSS), aluminum, barium, cobalt, titanium and vanadium in GW DUP 1 during spring 2024;
- TSS in GW DUP 2 during spring 2024;
- Iron, manganese, phosphorus, TSS, cobalt and vanadium GW DUP 1 during fall 2024; and
- Titanium in GW DUP 2 during fall 2024.

The analytical laboratory employed to perform the laboratory analyses (SGS) is accredited by the Standards Council of Canada/Canadian Association for Laboratory Accreditation in accordance with ISO/IEC 17025:1999 – "*General Requirements for the Competence of Testing and Calibration Laboratories*" for the tested parameters and has met the standards for proficiency testing developed by the Standards Council of Canada for parameters set out in the Soil, Ground Water and Sediment Standards.

Sample analysis dates provided on the laboratory analytical reports issued by SGS indicate that all sample analyses were performed within the required sample/extract hold times as indicated by the dates presented in columns for each sample parameter on the analytical report. The laboratory minimum detection limits were reported to be at or lower than the required MECP reporting detection limits for the parameters analyzed. A comparison of the internal laboratory duplicate samples indicates that all samples and the respective duplicates are within acceptable limits.

Upon review of the QA/QC results for spring and fall sampling programs, Pinchin has not identified any significant concerns that would warrant the invalidation of any of the field or laboratory data; and therefore, considers the data generated as part of this program to be reliable.

5.0 CONCLUSIONS

Based on the work completed, the following is a summary of the activities and findings of the 2024 water quality monitoring program:

- Groundwater samples were collected from all monitoring wells at the Site on April 23 and October 2, 2024, with the exception of BH6-II in the spring and fall due to dry conditions at the time of sampling, as well as BH4 in the fall due to insufficient volume at the time of sampling. All groundwater samples were submitted for laboratory analysis of parameters identified in the previous monitoring reports. Samples collected at monitoring well BH4-II

© 2025 Pinchin Ltd.

were also submitted for analysis of mercury and VOCs. The groundwater quality was assessed based on the ODWQS, APV and Guideline B-7;

- Surface water samples were collected from all monitoring locations on April 23 and October 2, 2024, and were submitted for laboratory analysis of parameters identified in the previous monitoring reports. Surface water quality was assessed based on the PWQO and CWQG;
- Groundwater flow at the Site is interpreted to be directed towards the east;
- All reported concentrations in the groundwater samples submitted for analysis satisfied the respective ODWQS parameters with the exception the following:
    - pH (low) at BH3-II, BH7-II and BH11;
    - Hardness (high) at BH1, BH2, BH4, BH4-II, BH5-II, BH6-III, BH8-I, BH9-I and BH10-I;
    - Hardness (low) at BH1, BH3-II, BH7-II, BH10-I and BH11;
    - Alkalinity (low) at BH3-II, BH7-II and BH11;
    - DOC at BH1, BH2, BH4, BH4-II, BH5-II, BH7-II, BH9-I and BH10-I;
    - Iron at BH2, BH9-I and BH11;
    - Manganese at BH1, BH2, BH4-II, BH5-II, BH6-III, BH8-I and BH9-I;
    - Turbidity at BH2, BH3-II, BH4, BH5-II, BH7-II, BH8-I, BH9-I, BH10-I and BH11-I; and
    - Aluminum at BH3-II, BH7-II and BH11.
- All reported concentrations in the groundwater samples near surface water bodies submitted for analysis satisfied the respective APV parameters with the exception of cobalt at BH9-I;
- All reported concentrations in the groundwater samples collected from the downgradient monitoring wells met the applicable Guideline B-7 criteria for all parameters analyzed with the exception of the following:
    - pH (low) at BH7-II;
    - TDS at BH5-II and BH9-I;
    - Nitrate at BH5-II, BH6-III and BH8-I;
    - DOC at all locations;

© 2025 Pinchin Ltd.

  - Iron at BH9-I;
  - Manganese at all locations except BH7-II; and
  - Aluminum at BH7-II.
- All reported concentrations in the surface water samples submitted for analysis satisfied the respective PWQO and/or CWQG parameters with the exception of the following:
  - pH (low) at SW1;
  - Phenols at all locations;
  - Iron at SW1, SW3 and SEEP;
  - Aluminum at SW1 and SW2;
  - Cobalt at SW3 and SEEP; and
  - Boron, phosphorus and chromium at SEEP.

Based on the results obtained from the existing groundwater monitoring wells and surface water monitoring locations, Pinchin has not identified any significant landfill related impacts at the Site aside from the SEEP. Concentrations of pH, TDS, iron, nitrate, DOC, aluminum and manganese parameters within the groundwater samples analyzed at the furthest downgradient monitoring locations (BH5-II, BH6-III, BH7-II, BH8-I and BH9-I) which exceeded the Guideline B-7 criteria are likely attributed to either naturally occurring conditions within the shallow unconfined aquifer on-site or from temperate impacts from leachate sourced from the waste deposits at the Site. All exceedances of the Guideline B-7 RUC are related to operational guidelines and/or aesthetic objectives associated with drinking water systems set by the ODWQS and are not considered to be an immediate significant human health or environmental concern originating from the Site with the exception of nitrate which is a health-related parameter. The elevated concentrations of nitrate are only quantified in some downgradient wells and often fluctuate throughout the historical record; seasonal fluctuations are also observed with higher concentrations quantified during the fall events. These concentrations are generally stable or decreasing, but should be confirmed during the next monitoring period. Furthermore, concentrations of nitrate quantified at the downgradient groundwater wells are not interpreted to be impacting the surface water quality at the Site as nitrate concentrations are observed to be at low levels at downstream monitoring locations SW3 (near-field) and SW2 (far-field).

© 2025 Pinchin Ltd.

6.0 RECOMMENDATIONS

Based on a review of the existing dataset and regulatory requirements to date, Pinchin recommends the following:

- Continue with routine monitoring of all the available groundwater monitoring wells and surface water monitoring locations during the spring and fall. Groundwater and surface water monitoring shall be completed with analyses for the parameters identified in the historical monitoring record. Monitoring well BH4-II should also be analyzed for mercury and VOCs. Considering the dataset completed thus far, it is Pinchin's opinion that sampling should continue in 2025 before the adequacy of the monitoring program can be fully evaluated;
- Surveyed elevations at monitoring wells BH1 and BH3-II will require adjustment for the 2025 groundwater elevation calculations by reducing the survey elevation by the measured length of cut PVC;
- Rehabilitation of the SEEP should be initiated in order to address the potential associated impacts to the adjacent surface water receptor; and
- The Client should continue to ensure that the requirements as specified in the CofA are complied with.

7.0 MONITORING AND SCREENING CHECKLIST

In accordance with the MECP Landfill Standards, the Monitoring and Screening Checklist for the Site completed by the Pinchin CEP is completed and provided in Appendix IX.

8.0 DISCLAIMER

This Water Quality Monitoring Program was performed for the Corporation of the Municipality of Magnetawan (Client) in order to investigate the environmental condition of the groundwater and surface water at the Chapman Waste Disposal Site (Site). The term recognized environmental condition means the presence or likely presence of any hazardous substance on a property under conditions that indicate an existing release, past release, or a material threat of a release of a hazardous substance into structures on the property or into the ground, groundwater, or surface water of the property.

This Water Quality Monitoring Program does not quantify the extent of the extent of the current and/or recognized environmental condition or the cost of any remediation.

© 2025 Pinchin Ltd.

Conclusions derived are specific to the immediate area of study and cannot be extrapolated extensively away from sample locations. Samples have been analyzed for a limited number of contaminants that are expected to be present at the Site, and the absence of information relating to a specific contaminant does not indicate that it is not present.

No environmental site assessment can wholly eliminate uncertainty regarding the potential for recognized environmental conditions on a property. Performance of this Water Quality Monitoring Program to the standards established by Pinchin is intended to reduce, but not eliminate uncertainty regarding the potential for recognized environmental conditions on the Site and recognizes reasonable limits on time and cost.

This Water Quality Monitoring Program was performed in general compliance with currently acceptable practices for environmental site investigations and specific Client requests as applicable to this Site.

This report was prepared for the exclusive use of the Client subject to the conditions and limitations contained within the duly authorized work plan. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it is the responsibility of the third parties. If additional parties require reliance on this report, written authorization from Pinchin will be required. Pinchin disclaims responsibility of consequential financial effects on transactions or property values, or requirements for follow up actions and costs. No other warranties are implied or expressed. Furthermore, this report should not be construed as legal advice.

Pinchin will not be responsible for any consequential or indirect damages. Pinchin will only be held liable for damages resulting from the negligence of Pinchin. Pinchin will not be liable for any losses or damage if the Client has failed within a period of two years following the date upon which the claim is discovered within the meaning of the Limitations Act, 2002 (Ontario) to commence legal proceedings against Pinchin to recover such losses or damage.

Pinchin makes no other representations whatsoever, including those concerning the legal significance of its findings, or as to other legal matters touched on in this report, including, but not limited to ownership of any property, or the application of any law to the facts set forth herein. With respect to regulatory compliance issues, regulatory statutes are subject to interpretation and these interpretations may change over time.

Certificate of Approval

Ministry of the Environment
Ontario

Provisional Certificate No. A 521202

PROVISIONAL CERTIFICATE OF APPROVAL
WASTE DISPOSAL SITE

Under The Environmental Protection Act, 1971 and the regulations and subject to the limitations thereof, this Provisional Certificate of Approval is issued to:

Township of Chapman
Box 70, R.R. # 1
Magnetawan, Ontario
P0A 1P0

for the use and operation of a 1.2 hectare dump site

all in accordance with the following plans and specifications:

Located: Lot 108, Concession A
Township of Chapman
District of Parry Sound

which includes the use of the site only for the receiving and disposal of the following categories of waste (NOTE: Use of the site for additional categories of wastes requires a new application and amendments to the Provisional Certificate of Approval) domestic and commercial wastes.

and subject to the following conditions:

1. No operation shall be carried out at the site after sixty days from this condition becoming enforceable unless this Certificate including the reasons for this condition has been registered by the applicant as an instrument in the appropriate Land Registry Office against title to the site and a duplicate registered copy thereof has been returned by the applicant to the Director.

Dated this 20th day of March, 1980.

Director, Section 39,
The Environmental Protection Act, 1971

Depth (ft / m)	Symbol	Description	Measured Depth (m)	Monitoring Well Details	Sample #	Recovery (%)
0 / 0		Ground Surface	0.00			
0–10 / 0–3		***Sand and Gravel*** Coarse sand and gravel, some cobbles, damp, no PHC odour or staining.	3.05	Riser; Bentonite		
10–13 / 3–4		***Sand and Gravel*** Coarse sand and gravel, large cobbles, damp, no PHC odour or staining.	3.96		SS1	
13–20 / 4–6		***Bedrock*** Bedrock. Auger refusal on assumed bedrock.	6.30	Screen; Silica Sand		
20 / 6		End of Borehole				

Contractor: CCC

Drilling Method: Hollow Auger

Well Casing Size: 5.08 cm

957 Cambrian Heights Drive

Suite 203

Sudbury, ON P3C 5S5

Grade Elevation: NA

Top of Casing Elevation: NA

Sheet: 1 of 1

Log of Borehole: BH8-I

Project #: 225335.001 **Logged By:** KM

Project: Hydrogeology Assessment

Client: Municipality of Magnetawan

Location: Chapman Waste Disposal Site, Magnetawan, Ontario

Drill Date: September 27, 2018 **Project Manager:** TM

SUBSURFACE PROFILE					SAMPLE	
Depth (ft / m)	Symbol	Description	Measured Depth (m)	Monitoring Well Details	Sample #	Recovery (%)
0 / 0		Ground Surface	0.00			
		Sand Coarse, brown sand with some gravel, no PHC odour or staining.		Riser; Bentonite		
					SS1	
			4.27			
		Sand and Gravel Coarse, brown sand and gravel, trace cobbles, no PHC odour or staining.		Screen; Silica Sand		
					SS2	
			6.05

Notes:

NC	Not calculable due to one or more of the concentrations being quantified over the reasonable detection limit (RDL) or the practical quantification limit (PQL).
BOLD	Bolded and shaded entries indicates that the relative percent difference (RPD) exceeds the industry standard of 50%.

QC SUMMARY

Method Blank: a blank matrix that is carried through the entire analytical procedure. Used to assess laboratory contamination.

Duplicate: Paired analysis of a separate portion of the same sample that is carried through the entire analytical procedure. Used to evaluate measurement precision.

LCS/Spike Blank: Laboratory control sample or spike blank refer to a blank matrix to which a known amount of analyte has been added. Used to evaluate analyte recovery and laboratory accuracy without sample matrix effects.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate laboratory accuracy with sample matrix effects.

Reference Material: a material or substance matrix matched to the samples that contains a known amount of the analyte of interest. A reference material may be used in place of a matrix spike.

RL: Reporting limit

RPD: Relative percent difference

AC: Acceptance criteria

Multielement Scan Qualifier: as the number of analytes in a scan increases, so does the chance of a limit exceedance by random chance as opposed to a real method problem. Thus, in multielement scans, for the LCS and matrix spike, up to 10% of the analytes may exceed the quoted limits by up to 10% absolute and the spike is considered acceptable.

Duplicate Qualifier: for duplicates as the measured result approaches the RL, the uncertainty associated with the value increases dramatically, thus duplicate acceptance limits apply only where the average of the two duplicates is greater than five times the RL.

Matrix Spike Qualifier: for matrix spikes, as the concentration of the native analyte increases, the uncertainty of the matrix spike recovery increases. Thus, the matrix spike acceptance limits apply only when the concentration of the matrix spike is greater than or equal to the concentration of the native analyte.

LEGEND

FOOTNOTES

NSS Insufficient sample for analysis.
RL Reporting Limit.
↑ Reporting limit raised.
↓ Reporting limit lowered.
NA The sample was not analysed for this analyte
ND Non Detect

Results relate only to the sample tested.
Data reported represent the sample as submitted to SGS. Solid samples expressed on a dry weight basis.
"Temperature Upon Receipt" is representative of the whole shipment and may not reflect the temperature of individual samples.
Analysis conducted on samples submitted pursuant to or as part of Reg. 153/04, are in accordance to the "Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act and Excess Soil Quality" published by the Ministry and dated March 9, 2004 as amended.

SGS provides criteria information (such as regulatory or guideline limits and summary of limit exceedances) as a service. Every attempt is made to ensure the criteria information in this report is accurate and current, however, it is not guaranteed. Comparison to the most current criteria is the responsibility of the client and SGS assumes no responsibility for the accuracy of the criteria levels indicated.

SGS Canada Inc. statement of conformity decision rule does not consider uncertainty when analytical results are compared to a specified standard or regulation.
This document is issued, on the Client's behalf, by the Company under its General Conditions of Service available on request and accessible at http://www.sgs.com/terms_and_conditions.htm.
The Client's attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any other holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Reproduction of this analytical report in full or in part is prohibited.

This report supersedes all previous versions.

Request for Laboratory Services and CHAIN OF CUSTODY (General)

SGS Environmental Services - Lakefield: 185 Concession St., Lakefield, ON K0L 2H0 Phone: 705-652-2000 Toll Free: 877-747-7658 Fax: 705-652-6365 Web: www.ca.sgs.com {4}

SGS Environmental Services - London: 657 Consortium Court, London, ON, N6E 2S8 Phone: 519-672-4500 Toll Free: 877-848-8060 Fax: 519-672-0361 Web: www.ca.sgs.com {4}

Laboratory Information Section

Received Date (mm/dd/yyyy): APR 25 2024 APR 25 2024

LAB LIMS #: Apr 15763-M

Received Time (After Hours Only): ___:___

Temperature Upon Receipt (°C): 4x3

Billing & Reporting Information

Invoice/Receipt to {3}:

Company:	Pinchin
Attention:	Alana Valle
Address:	662 Falconbridge Rd, Unit 3
	Sudbury, Ontario
	P3A 4S4
Email:	avalle@pinchin.com

Quote #: 2023 544

Attached Parameter List: ☑ YES ☐ NO

Turnaround Time

Is *Rush Turnaround Time Required? ☐ YES ☒ NO

Specify:

* Rush TA Requests Require Lab Approval

Sample Information

Sample Identifier	Date Sampled (mm/dd/yy)	Time Sampled	# of Bottles	Analysis Requested (please enter the analysis required below and check off which analysis applies to each sample)							
				Field Filtered	Field Temp (°C)	Field pH		SW Package			
SW1	04/23/24	1030	11	W				X			
SW2	↓	↓	11	N				X			
SW3			11	N				X			
SEEP		↓	11	N				X			
SW DUP	↓	500	11	N				X			
Returning blank bottle set - did not use											

Sampled By {1}:	(Name) Jenny Porter	(Signature) JPor	Date:	04 24 24	(mm/dd/yy)
Relinquished by {2}:	(Name) JP	(Signature) JP	Date:	04 24 24	(mm/dd/yy)

Note: {1} Submission of samples to SGS is acknowledgement that you have been provided direction on sample collection/handling and transportation of samples. {2} Submission of samples to SGS is considered authorization for completion of work. Signatures may appear on this form or be retained on file in the contract, or in an alternative format (e.g. shipping documents). {3} Results may be sent by email to an unlimited number of addresses for no additional cost. Fax is available upon request. {4} Completion of work may require the subcontracting of samples between the London and Lakefield laboratories.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. (Printed copies are available upon request.) Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Samples	Ground Water (14)

LABORATORY DETAILS

Project Specialist	Jill Campbell, B.Sc.,GISAS
Laboratory	SGS Canada Inc.
Address	185 Concession St., Lakefield ON, K0L 2H0
Telephone	2165
Facsimile	705-652-6365
Email	jill.campbell@sgs.com
SGS Reference	CA15766-APR24
Received	04/25/2024
Approved	05/06/2024
Report Number	CA15766-APR24 R1
Date Reported	05/06/2024

COMMENTS

Temperature of Sample upon Receipt: 3 degrees C
Cooling Agent Present: Yes
Custody Seal Present: Yes

Chain of Custody Number: n/a

BOD spike REP high, accepting results based on other qc

SIGNATORIES

Jill Campbell, B.Sc.,GISAS

Method Blank: a blank matrix that is carried through the entire analytical procedure. Used to assess laboratory contamination.
Duplicate: Paired analysis of a separate portion of the same sample that is carried through the entire analytical procedure. Used to evaluate measurement precision.
LCS/Spike Blank: Laboratory control sample or spike blank refer to a blank matrix to which a known amount of analyte has been added. Used to evaluate analyte recovery and laboratory accuracy without sample matrix effects.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate laboratory accuracy with sample matrix effects.
Reference Material: a material or substance matrix matched to the samples that contains a known amount of the analyte of interest. A reference material may be used in place of a matrix spike.
RL: Reporting limit
RPD: Relative percent difference
AC: Acceptance criteria

Multielement Scan Qualifier: as the number of analytes in a scan increases, so does the chance of a limit exceedance by random chance as opposed to a real method problem. Thus, in multielement scans, for the LCS and matrix spike, up to 10% of the analytes may exceed the quoted limits by up to 10% absolute and the spike is considered acceptable.
Duplicate Qualifier: for duplicates as the measured result approaches the RL, the uncertainty associated with the value increases dramatically, thus duplicate acceptance limits apply only where the average of the two duplicates is greater than five times the RL.
Matrix Spike Qualifier: for matrix spikes, as the concentration of the native analyte increases, the uncertainty of the matrix spike recovery increases. Thus, the matrix spike acceptance limits apply only when the concentration of the matrix spike is greater than or equal to the concentration of the native analyte.

QC SUMMARY

LEGEND

FOOTNOTES

NSS	Insufficient sample for analysis.
RL	Reporting Limit.
↑	Reporting limit raised.
↓	Reporting limit lowered.
NA	The sample was not analysed for this analyte
ND	Non Detect

Results relate only to the sample tested.
Data reported represent the sample as submitted to SGS. Solid samples expressed on a dry weight basis.
"Temperature Upon Receipt" is representative of the whole shipment and may not reflect the temperature of individual samples.
Analysis conducted on samples submitted pursuant to or as part of Reg. 153/04, are in accordance to the "Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act and Excess Soil Quality" published by the Ministry and dated March 9, 2004 as amended.

SGS provides criteria information (such as regulatory or guideline limits and summary of limit exceedances) as a service. Every attempt is made to ensure the criteria information in this report is accurate and current, however, it is not guaranteed. Comparison to the most current criteria is the responsibility of the client and SGS assumes no responsibility for the accuracy of the criteria levels indicated.

SGS Canada Inc. statement of conformity decision rule does not consider uncertainty when analytical results are compared to a specified standard or regulation.
This document is issued, on the Client's behalf, by the Company under its General Conditions of Service available on request and accessible at http://www.sgs.com/terms_and_conditions.htm.
The Client's attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any other holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Reproduction of this analytical report in full or in part is prohibited.

This report supersedes all previous versions.

Method Blank: a blank matrix that is carried through the entire analytical procedure. Used to assess laboratory contamination.
Duplicate: Paired analysis of a separate portion of the same sample that is carried through the entire analytical procedure. Used to evaluate measurement precision.
LCS/Spike Blank: Laboratory control sample or spike blank refer to a blank matrix to which a known amount of analyte has been added. Used to evaluate analyte recovery and laboratory accuracy without sample matrix effects.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate laboratory accuracy with sample matrix effects.
Reference Material: a material or substance matrix matched to the samples that contains a known amount of the analyte of interest. A reference material may be used in place of a matrix spike.
RL: Reporting limit
RPD: Relative percent difference
AC: Acceptance criteria

Multielement Scan Qualifier: as the number of analytes in a scan increases, so does the chance of a limit exceedance by random chance as opposed to a real method problem. Thus, in multielement scans, for the LCS and matrix spike, up to 10% of the analytes may exceed the quoted limits by up to 10% absolute and the spike is considered acceptable.
Duplicate Qualifier: for duplicates as the measured result approaches the RL, the uncertainty associated with the value increases dramatically, thus duplicate acceptance limits apply only where the average of the two duplicates is greater than five times the RL.
Matrix Spike Qualifier: for matrix spikes, as the concentration of the native analyte increases, the uncertainty of the matrix spike recovery increases. Thus, the matrix spike acceptance limits apply only when the concentration of the matrix spike is greater than or equal to the concentration of the native analyte.

LEGEND

FOOTNOTES

NSS	Insufficient sample for analysis.
RL	Reporting Limit.
↑	Reporting limit raised.
↓	Reporting limit lowered.
NA	The sample was not analysed for this analyte
ND	Non Detect

Results relate only to the sample tested.
Data reported represent the sample as submitted to SGS. Solid samples expressed on a dry weight basis.
"Temperature Upon Receipt" is representative of the whole shipment and may not reflect the temperature of individual samples.
Analysis conducted on samples submitted pursuant to or as part of Reg. 153/04, are in accordance to the "Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act and Excess Soil Quality" published by the Ministry and dated March 9, 2004 as amended.

SGS provides criteria information (such as regulatory or guideline limits and summary of limit exceedances) as a service. Every attempt is made to ensure the criteria information in this report is accurate and current, however, it is not guaranteed. Comparison to the most current criteria is the responsibility of the client and SGS assumes no responsibility for the accuracy of the criteria levels indicated.

SGS Canada Inc. statement of conformity decision rule does not consider uncertainty when analytical results are compared to a specified standard or regulation.
This document is issued, on the Client's behalf, by the Company under its General Conditions of Service available on request and accessible at http://www.sgs.com/terms_and_conditions.htm.
The Client's attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any other holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Reproduction of this analytical report in full or in part is prohibited.

This report supersedes all previous versions.

QC SUMMARY

Method Blank: a blank matrix that is carried through the entire analytical procedure. Used to assess laboratory contamination.

Duplicate: Paired analysis of a separate portion of the same sample that is carried through the entire analytical procedure. Used to evaluate measurement precision.

LCS/Spike Blank: Laboratory control sample or spike blank refer to a blank matrix to which a known amount of analyte has been added. Used to evaluate analyte recovery and laboratory accuracy without sample matrix effects.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate laboratory accuracy with sample matrix effects.

Reference Material: a material or substance matrix matched to the samples that contains a known amount of the analyte of interest. A reference material may be used in place of a matrix spike.

RL: Reporting limit

RPD: Relative percent difference

AC: Acceptance criteria

Multielement Scan Qualifier: as the number of analytes in a scan increases, so does the chance of a limit exceedance by random chance as opposed to a real method problem. Thus, in multielement scans, for the LCS and matrix spike, up to 10% of the analytes may exceed the quoted limits by up to 10% absolute and the spike is considered acceptable.

Duplicate Qualifier: for duplicates as the measured result approaches the RL, the uncertainty associated with the value increases dramatically, thus duplicate acceptance limits apply only where the average of the two duplicates is greater than five times the RL.

Matrix Spike Qualifier: for matrix spikes, as the concentration of the native analyte increases, the uncertainty of the matrix spike recovery increases. Thus, the matrix spike acceptance limits apply only when the concentration of the matrix spike is greater than or equal to the concentration of the native analyte.

LEGEND

FOOTNOTES

NSS Insufficient sample for analysis.
RL Reporting Limit.
↑ Reporting limit raised.
↓ Reporting limit lowered.
NA The sample was not analysed for this analyte
ND Non Detect

Results relate only to the sample tested.
Data reported represent the sample as submitted to SGS. Solid samples expressed on a dry weight basis.
"Temperature Upon Receipt" is representative of the whole shipment and may not reflect the temperature of individual samples.
Analysis conducted on samples submitted pursuant to or as part of Reg. 153/04, are in accordance to the "Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act and Excess Soil Quality" published by the Ministry and dated March 9, 2004 as amended.

SGS provides criteria information (such as regulatory or guideline limits and summary of limit exceedances) as a service. Every attempt is made to ensure the criteria information in this report is accurate and current, however, it is not guaranteed. Comparison to the most current criteria is the responsibility of the client and SGS assumes no responsibility for the accuracy of the criteria levels indicated.

SGS Canada Inc. statement of conformity decision rule does not consider uncertainty when analytical results are compared to a specified standard or regulation.
This document is issued, on the Client's behalf, by the Company under its General Conditions of Service available on request and accessible at http://www.sgs.com/terms_and_conditions.htm.
The Client's attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. APPENDIX IX

Monitoring and Screening Checklist

Appendix D-Monitoring and Screening Checklist
General Information and Instructions

General Information: The checklist is to be completed, and submitted with the Monitoring Report.
Instructions: A complete checklist consists of:
(a) a completed and signed checklist, including any additional pages of information which can be attached as needed to provide further details where indicated.
(b) completed contact information for the Competent Environmental Practitioner (CEP)
(c) self-declaration that CEP(s) meet(s) the qualifications as set out below and in Section 1.2 of the Technical Guidance Document.

Definition of Groundwater CEP:
For groundwater, the CEP must have expertise in hydrogeology and meet one of the following:
(a) the person holds a licence, limited licence or temporary licence under the *Professional Engineers Act*; or
(b) the person holds a certificate of registration under the *Professional Geoscientists Act, 2000* and is a practicing member, temporary, member or limited member of the Association of Professional Geoscientists of Ontario. O. Reg. 66/08, s. 2..
Definition of Surface water CEP:
A CEP for surface water assessments is a scientist, professional engineer or professional geoscientist as described in (a) and (b) above with demonstrated experience and post-secondary education, either a diploma or degree, in hydrology, aquatic ecology, limnology, aquatic biology, physical geography with specialization in surface water, and/or water resource management.

The type of scientific work that a CEP performs must be consistent with that person's education and experience. If an individual has appropriate training and credentials in both groundwater and surface water and is responsible for both areas of expertise, the CEP may then complete and validate both sections of the checklist.

Monitoring Report and Site Information	
Waste Disposal Site Name	Chapman Waste Disposal Site
Location (e.g. street address, lot, concession)	Lot 108, Concession A, within the Municipality of Magnetawan, District of Parry Sound, Ontario
GPS Location (taken within the property boundary at front gate/ front entry)	Universal Transverse Mercator (UTM) coordinates Zone 17U, 606831 meters (m) Easting and 5063200 m Northing (North American Datum 1983)
Municipality	Magnetawan
Client and/or Site Owner	Corporation of the Municipality of Magnetawan
Monitoring Period (Year)	2024
This Monitoring Report is being submitted under the following:	
Certificate of Approval No.:	A521202
Director's Order No.:	Type Here
Provincial Officer's Order No.:	Type Here
Other:	Type Here

Report Submission Frequency	◉ **Annual** ○ **Other**	Specify (Type Here):
The site is:	◉ **Active** ○ **Inactive** ○ **Closed**	
If closed, specify C of A, control or authorizing document closure date:		Select Date
Has the nature of the operations at the site changed during this monitoring period?	○ **Yes** ◉ **No**	
If yes, provide details:	Type Here	
Have any measurements been taken since the last reporting period that indicate landfill gas volumes have exceeded the MOE limits for subsurface or adjacent buildings? (i. e. exceeded the LEL for methane)	○ Yes ◉ No	

Groundwater WDS Verification:

Based on all available information about the site and site knowledge, it is my opinion that:

Sampling and Monitoring Program Status:

1) The monitoring program continues to effectively characterize site conditions and any groundwater discharges from the site. All monitoring wells are confirmed to be in good condition and are secure:	◉ **Yes** ○ **No**	If no, list exceptions (Type Here):
2) All groundwater, leachate and WDS gas sampling and monitoring for the monitoring period being reported on was successfully completed as required by Certificate(s) of Approval or other relevant authorizing/control document(s):	○ **Yes** ○ **No** ◉ **Not Applicable**	If no, list exceptions below or attach information.

Groundwater Sampling Location	**Description/Explanation for change (change in name or location, additions, deletions)**	**Date**
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date

3) a) Some or all groundwater, leachate and WDS gas sampling and monitoring requirements have been established or defined outside of a ministry C of A, authorizing, or control document.	◉ **Yes** ○ **No** ○ **Not Applicable**	
b) If yes, the sampling and monitoring identified under 3(a) for the monitoring period being reported on was successfully completed in accordance with established protocols, frequencies, locations, and parameters developed as per the Technical Guidance Document:	○ **Yes** ◉ **No** ○ **Not Applicable**	If no, list exceptions below or attach additional information.

Groundwater Sampling Location	**Description/Explanation for change (change in name or location, additions, deletions)**	**Date**
BH6-II	Dry	Spring and Fall 2024
BH4-II	Insufficient volume	Fall 2024
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date

4) All field work for groundwater investigations was done in accordance with standard operating procedures as established/outlined per the Technical Guidance Document (including internal/external QA/QC requirements) (Note: A SOP can be from a published source, developed internally by the site owner's consultant, or adopted by the consultant from another organization):	◉ **Yes** ○ **No**	If no, specify (Type Here):

Sampling and Monitoring Program Results/WDS Conditions and Assessment:

5) The site has an adequate buffer, Contaminant Attenuation Zone (CAZ) and/or contingency plan in place. Design and operational measures, including the size and configuration of any CAZ, are adequate to prevent potential human health impacts and impairment of the environment.	○ **Yes** ◉ **No**	A CAZ has not been established for the Site. However, it should be noted that based on the current observed water quality data, landfill derived leachate impacts appear to attenuate prior to the property boundary. Future investigations should involve the development/formal approval of a CAZ for this Site.	
6) The site meets compliance and assessment criteria.	◉ **Yes** ○ **No**	If no, list and explain exceptions (Type Here):	
7) The site continues to perform as anticipated. There have been no unusual trends/ changes in measured leachate and groundwater levels or concentrations.	◉ **Yes** ○ **No**	If no, list exceptions and explain reason for increase/change (Type Here):	
1) Is one or more of the following risk reduction practices in place at the site: ***(a)*** **There is minimal reliance on natural attenuation of leachate due to the presence of an effective waste liner and active leachate collection/treatment; or** ***(b)*** **There is a predictive monitoring program in-place (modeled indicator concentrations projected over time for key locations); or** ***(c)*** **The site meets the following two conditions (typically achieved after 15 years or longer of site operation):** ***i.*** **The site has developed stable leachate mound(s) and stable leachate plume geometry/concentrations; and** ***ii.*** **Seasonal and annual water levels and water quality fluctuations are well understood.**	◉ **Yes** ○ **No**	**Note which practice(s):**	☐ **(a)** ☐ **(b)** ☒ **(c)**
9) Have trigger values for contingency plans or site remedial actions been exceeded (where they exist):	○ **Yes** ○ **No** ◉ **Not Applicable**	If yes, list value(s) that are/have been exceeded and follow-up action taken (Type Here):	

Groundwater CEP Declaration:

I am a licensed professional Engineer or a registered professional geoscientist in Ontario with expertise in hydrogeology, as defined in Appendix D under Instructions. Where additional expertise was needed to evaluate the site monitoring data, I have relied on individuals who I believe to be experts in the relevant discipline, who have co-signed the compliance monitoring report or monitoring program status report, and who have provided evidence to me of their credentials.

I have examined the applicable Certificate of Approval and any other environmental authorizing or control documents that apply to the site. I have read and followed the Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water Technical Guidance Document (MOE, 2010, or as amended), and associated monitoring and sampling guidance documents, as amended from time to time. I have reviewed all of the data collected for the above-referenced site for the monitoring period(s) identified in this checklist. Except as otherwise agreed with the ministry for certain parameters, all of the analytical work has been undertaken by a laboratory which is accredited for the parameters analysed to *ISO/IEC 17025:2005 (E)- General requirements for the competence of testing and calibration laboratories,* or as amended from time to time by the ministry.

If any exceptions or potential concerns have been noted in the questions in the checklist attached to this declaration, it is my opinion that these exceptions and concerns are minor in nature and will be rectified for the next monitoring/reporting period. Where this is not the case, the circumstances concerning the exception or potential concern and my client's proposed action have been documented in writing to the Ministry of the Environment District Manager in a letter from me dated:

12-Mar-2025

Recommendations:

Based on my technical review of the monitoring results for the waste disposal site:

◉ **No changes to the monitoring program are recommended** ○ **The following change(s) to the monitoring program is/are recommended:**	Surveyed elevations at monitoring wells BH1 and BH3-II will require adjustment for the 2025 groundwater elevation calculations by reducing the survey elevation by the measured length of cut PVC.
○ **No Changes to site design and operation are recommended** ◉ **The following change(s) to the site design and operation is/ are recommended:**	The observed landfill seep next to BH9-1 should be rehabilitated.

Surface Water WDS Verification:

Provide the name of surface water body/bodies potentially receiving the WDS effluent and the approximate distance to the waterbody (including the nearest surface water body/bodies to the site):

Name (s)	Unnamed creek to the south of the Site Unnamed creek to the east of the Site
Distance(s)	Approximately 50 m south of the Site Approximately 50 m east of the Site

Based on all available information and site knowledge, it is my opinion that:

Sampling and Monitoring Program Status:

1) The current surface water monitoring program continues to effectively characterize the surface water conditions, and includes data that relates upstream/background and downstream receiving water conditions:	(●) Yes ( ) No	If no, identify issues (Type Here):
2) All surface water sampling for the monitoring period being reported was successfully completed in accordance with the Certificate(s) of Approval or relevant authorizing/control document(s) (if applicable):	( ) Yes ( ) No (●) **Not applicable (No C of A, authorizing / control document applies)**	If no, specify below or provide details in an attachment.

Surface Water Sampling Location	Description/Explanation for change (change in name or location, additions, deletions)	Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date

3) a) Some or all surface water sampling and monitoring program requirements for the monitoring period have been established outside of a ministry C of A or authorizing/control document.	◉ **Yes** ○ **No** ○ **Not Applicable**	
b) If yes, all surface water sampling and monitoring identified under 3 (a) was successfully completed in accordance with the established program from the site, including sampling protocols, frequencies, locations and parameters) as developed per the Technical Guidance Document:	◉ **Yes** ○ **No** ○ **Not Applicable**	If no, specify below or provide details in an attachment.

Surface Water Sampling Location	**Description/Explanation for change (change in name or location, additions, deletions)**	**Date**
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date

4) All field work for surface water investigations was done in accordance with standard operating procedures, including internal/external QA/QC requirements, as established/ outlined as per the Technical Guidance Document, MOE 2010, or as amended. (Note: A SOP can be from a published source, developed internally by the site owner's consultant, or adopted by the consultant from another organization):	◉ **Yes** ○ **No**	If no, specify (Type Here):

Sampling and Monitoring Program Results/WDS Conditions and Assessment:

5) The receiving water body meets surface water-related compliance criteria and assessment criteria: i.e., there are no exceedances of criteria, based on MOE legislation, regulations, Water Management Policies, Guidelines and Provincial Water Quality Objectives and other assessment criteria (e.g., CWQGs, APVs), as noted in Table A or Table B in the Technical Guidance Document (Section 4.6):	○ **Yes** ◉ **No**

If no, list parameters that exceed criteria outlined above and the amount/percentage of the exceedance as per the table below or provide details in an attachment:

Parameter	Compliance or Assessment Criteria or Background	Amount by which Compliance or Assessment Criteria or Background Exceeded
e.g. Nickel	e.g. C of A limit, PWQO, background	e.g. X% above PWQO
pH	PWQO: 6.5-8.5 CWQG: 6.5-9.0	SW1: 6.33 (spring) and 6.47 (fall)
Chromium	PWQO: 0.0089 mg/L CWQG: 0.001 mg/L	SEEP: 0.00142 (fall)
Phenols	PWQO: 0.001 mg/L CWQG: 0.004 mg/L	SW1: 0.002 (spring) SW2: 0.002 (spring and fall) SW3: 0.002 (spring and fall) SEEP: 0.002 (spring and fall)
Boron	PWQO: 0.20 mg/L CWQG: 1.50 mg/L	SEEP: 0.274 (spring) and 0.203 (fall)
Iron	PWQO: 0.3 mg/L CWQG: 0.3 mg/L	SW1: 0.309 (fall) SW3: 0.647 (spring) and 1.25 (fall) SEEP: 7.04 (spring) and 35.5 (fall)
Phosphorus	PWQO:0.03 mg/L	SEEP: 0.039 (fall)
Aluminum	PWQO: 0.075 mg/L CWQG: 0.1 mg/L	SW1: 0.162 (spring) and 0.119 (fall) SW2: 0.110 (spring)
Cobalt	PWQO: 0.0064 mg/L	SW3: 0.00153 (spring) and 0.0064 (fall) SEEP: 0.0166 (spring) and 0.0324 (fall)
6) In my opinion, any exceedances listed in Question 5 are the result of non-WDS related influences (such as background, road salting, sampling site conditions)?	○ **Yes** ◉ **No**	

7) All monitoring program surface water parameter concentrations fall within a stable or decreasing trend. The site is not characterized by historical ranges of concentrations above assessment and compliance criteria.	◉ **Yes** ○ **No**	If no, list parameters and stations that is outside the expected range. Identify whether parameter concentrations show an increasing trend or are within a high historical range (Type Here)
8) For the monitoring program parameters, does the water quality in the groundwater zones adjacent to surface water receivers exceed assessment or compliance criteria (e.g. , PWQOs, CWQGs, or toxicity values for aquatic biota (APVs)):	◉ Yes ○ No ○ Not Known ○ Not Applicable	Only marginal cobalt exceedance at BH9-I.
9) Have trigger values for contingency plans or site remedial actions been exceeded (where they exist):	○ **Yes** ○ **No** ◉ **Not Applicable**	If yes, list value(s) that are/have been exceeded and follow-up action taken (Type Here)

Surface Water CEP Declaration:

I, the undersigned hereby declare that I am a Competent Environmental Practitioner as defined in Appendix D under Instructions, holding the necessary level of experience and education to design surface water monitoring and sampling programs, conduct appropriate surface water investigations and interpret the related data as it pertains to the site for this monitoring period.

I have examined the applicable Certificate of Approval and any other environmental authorizing or control documents that apply to the site. I have read and followed the Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water Technical Guidance Document (MOE, 2010, or as amended) and associated monitoring and sampling guidance documents, as amended from time to time. I have reviewed all of the data collected for the above-referenced site for the monitoring period(s) identified in this checklist. Except as otherwise agreed with the ministry for certain parameters, all of the analytical work has been undertaken by a laboratory which is accredited for the parameters analysed to *ISO/IEC 17025:2005 (E)- General requirements for the competence of testing and calibration laboratories,* or as amended from time to time by the ministry.

If any exceptions or potential concerns have been noted in the questions in the checklist attached to this declaration, it is my opinion that these exceptions and concerns are minor in nature or will be rectified for future monitoring events. Where this is not the case, the circumstances concerning the exception or potential concern and my client's proposed action have been documented in writing to the Ministry of the Environment District Manager in a letter from me dated:

12-Mar-2025

Recommendations:

Based on my technical review of the monitoring results for the waste disposal site:

◉ **No Changes to the monitoring program are recommended** ○ **The following change(s) to the monitoring program is/are recommended:**	Type Here
◉ **No changes to the site design and operation are recommended** ○ **The following change(s) to the site design and operation is/are recommended:**	Type Here
